Results of the 2004 Performance Measures for the California Medi-Cal Managed Care Program

Introduction

In 2003, California's Medi-Cal Managed Care Program funded medical services for approximately 2.9 million Medi-Cal beneficiaries in 22 counties across California. Utilizing three models of health care delivery, Geographic Managed Care (GMC), the County-Organized Health System (COHS), and the Two-Plan Model, which includes commercial plans (CPs) and Local Initiatives (LIs), the California Department of Health Services (CDHS) contracted with 22 managed care plans to provide health care services for Medi-Calqualified adults and children.

Table 1 provides an overview of the models and their characteristics.

Table 1. Medi-Cal Managed Care Program Models

Model	Characteristics
Geographic Managed Care (GMC)	Mandatory enrollment of Temporary Assistance to Needy Families (TANF) population into commercially operated managed care plan, with enrollee choosing between multiple plans in area.
County-Organized Health System (COHS)	Mandatory enrollment of nearly all Medi-Cal eligible population into managed care system developed by the county.
Two-Plan Model (includes Commercial Plans [CPs] and Local Initiatives [LIs])	Mandatory enrollment of TANF population into one of two managed care entities. CP is a commercially operated managed care plan and LI is a community-developed plan designed to meet the specific needs of the community served. Both CP and LI model plans can subcontract with entities to provide services in the respective county of operation.

Table 2 lists the plans, contract/model type, counties served.

To effectively assess the quality of care provided by contracted health plans during 2003, the CDHS required each plan to report rates for a series of performance measures from the Health Employer Data and Information Set (HEDIS®¹). Developed by the National Committee for Quality Assurance (NCQA), HEDIS is a nationally recognized, standardized set of performance indicators that measure access, utilization, and quality. CDHS selected 11 HEDIS measures that assess the care provided to the largest segment of the Medi-Cal population, young women, and children. Additionally, CDHS required County Organized Health System plans to report a rate for provision of retinal eye exams as a substitute for reporting Well-Child Visits in the Third through Sixth Year of Life. As the CDHS model of care serves a greater percentage of older enrollees, many of whom have chronic care conditions, screening for diabetes is essential as a preventive measure and in treatment of this chronic condition. Each of the 11 HEDIS measures selected by CDHS were audited by NCQA certified auditors. This report presents the results of the performance measures, as reported in June 2004.

For all measures, there is a continuous eligibility requirement defined as the time in months or years that the beneficiary must be enrolled in the Medi-Cal managed care plan before a particular date or event. The rates presented reflect select services for a portion of the Medi-Cal managed care population, providing a proximal gauge of plan access, timeliness of services and quality of care. Several factors may influence a plan's scores including the plan's ability to capture and report data, the unique characteristics of the member population, and the organization of the provider networks within specific geographic areas. Therefore, this information is best used to develop a composite sketch of the systems of quality employed by the managed care plans in delivering care and services.

II. Report Organization

This report is organized into two sections, reflecting health plan rates and rates by model type. For each measure, a Medi-Cal managed care weighted average has been calculated to provide a comparative statistic as to the average score for all participating plans. By establishing the weighted average, versus a simple average, this statistic accounts for variations in membership across plans.

For each measure, the report also identifies Minimum Performance Levels (MPLs) and High Performance Levels (HPLs). These indicators are based upon the MMCD All Plan Letter 02008 dated November 26, 2002. Establishment of MPLs not only permits health plans and CDHS to detect opportunities for improvement, but use of HPLs allows for identification of performance that exceeds national achievement. Used alongside the program-wide weighted averages, these benchmarks facilitate the assessment of quality and provide the basis for strategic planning among the plans and CDHS.
