

**Framework for Understanding
Mental Health and Substance Use
in California's Duals Demonstration**
DRAFT

California's dual eligible population includes many individuals who need mental health services. This includes people with short-term needs and those with chronic needs who qualify for Medicare and Medi-Cal due to a psychiatric disability. Substance abuse frequently co-occurs among these individuals. Patient-centered, coordinated care models should address the full continuum of services beneficiaries need, including medical care, mental illness and substance use services, to include medication assisted treatments, in a seamlessly coordinated manner. The following concepts have been drafted to set the stage for future conversations around the coordination of mental health and substance use services within California's Duals Demonstration.

- 1) There is no one-size-fits-all approach to coordinating mental health and substance use services.
 - The appropriate model depends on patient needs, on-site capacity, the funding environment, community resources, and local partnerships.
- 2) Care management should be broadly defined and aimed toward recovery.
 - Reimbursement structures should consider supporting care management and service provision based on a recovery trajectory and not a narrow medical model.
 - Care management should consider employing team-based approaches, and where possible, alternative options for consultations, such as telemedicine and an e-referrals.
- 3) Adequate screening and links to services for mental illness and substance use disorders within primary care can facilitate treatment of these conditions before they become severe and disabling.
 - Coverage of federally allowable mental health and substance use benefits will be important for care coordination.
 - Plans should include traditional mental health and substance use providers in their networks.
- 4) Person-centered health homes that emphasize communication, coordination, shared records and active outreach can improve care for beneficiaries with mental illness and substance use disorders.
 - Ideally behavioral health and medical services would be co-located. The primary health home should be clearly designated so there is clear responsibility for leading care coordination. For those with severe mental or substance use disorders, that health home often will be located with a community substance use and/or mental health provider.
 - Data sharing/privacy guidelines and data management tools should facilitate sharing of essential treatment-related information while protecting confidentiality.
- 5) Financing arrangements should be developed with a focus on aligning incentives to deliver the right care where and when people want and need it.
 - Care coordination has the potential to rebalance service delivery away from the hospital and emergency department and instead to community-based services, resulting in improved health outcomes and lower costs.

- Coordinated models should reduce the administrative overhead required for claims processing.
