6.5	Policy Update and File Maintenance Tasks.....	114
6.6	Monitoring Payment Method Integrity.....	116
6.7	Implications for Growth in Hospital Cost.....	124
<b>7</b>	<b>Business Requirements for CA-MMIS Changes.....</b>	<b>128</b>
7.1	Summary of Requirements .....	128
7.2	Reference Data System .....	131
BR-Ref-1:	Add new system parameters and lists .....	131
BR-Ref-2:	Define new adjudication edits .....	133
BR-Ref-3:	View/update new reference DRG pricing file online .....	133
BR-Ref-4:	Batch update process for DRG pricing file .....	134
7.3	Provider Master File .....	134
BR-Prov-1:	Allow new fields to be viewable and updateable .....	134
BR-Prov-2:	Batch update for new fields supporting DRG pricing ....	135
7.4	TAR Data Entry – SURGE and SAR .....	135
BR-TAR-1:	TAR only admit on most inpatient stays .....	135
7.5	Inpatient Claim Data Entry .....	136
BR-Clm-Entry-1:	Capture additional fields on inpatient claims.....	136
7.6	Adjudication Edits .....	137
BR-Adj-Edit-1:	Pricing method edit.....	137
BR-Adj-Edit-2:	Inpatient claim data validity edits .....	138

BR-Adj-Edit-3: HCAC and erroneous surgery edits .....	140
BR-Adj-Edit-4: DRG pricing parameter edits .....	141
BR-Adj-Edit-5: DRG grouping edits .....	144
BR-Adj-Edit-6: Post DRG grouping edits .....	145
BR-Adj-Edit-7: TAR edits within claims adjudication.....	146
7.7 Claims Pricing.....	152
BR-Pricing-1: Add branching logic.....	152
BR-Pricing-2: Retrieve additional claim data for DRG pricing .....	153
BR-Pricing-3: Add call to diagnosis/procedure code mapper .....	154
BR-Pricing-4: Build DRG grouping input record.....	155
BR-Pricing-5: Call health care-acquired condition (HCAC) utility ....	160
BR-Pricing-6: Add calls to DRG grouping software.....	160
BR-Pricing-7: Add logic to perform DRG pricing .....	161
BR-Pricing-8: Store DRG pricing values .....	161
BR-Pricing-9: Allow users to view claim DRG pricing fields .....	163
BR-Pricing-10: Price admin level 2 claims like admin level 1 .....	164
BR-Pricing-11: Add new rehabilitation service pricing logic .....	164
7.8 Processing Final Claim after Interim Claims.....	165
BR-Final-Clm-1: Voiding interim claims .....	165
7.9 Reporting DRG Pricing Information.....	166
BR-Rptng-1: Remittance advice .....	166
BR-Rptng-2: Standard DRG pricing reports.....	166
BR-Rptng-3: Data warehouse extracts .....	170
7.10 Database Changes .....	175
BR-DB-1: Add a reference DRG pricing file.....	175
BR-DB-2: Provider master file .....	176
BR-DB-3: Claim input from provider side file .....	177
BR-DB-4: Claim DRG pricing file.....	181
7.11 Data Configuration .....	185
BR-Config-1: Initial implementation data configuration .....	185
7.12 Unresolved Requirements.....	186
BR-Unreslvd-1: CCS and non-CCS payment on a single stay.....	186
7.13 Payment Policy Flowchart.....	187
Appendices.....	199
Appendix A Medicaid Care Categories by APR-DRG.....	199
Appendix B Medi-Cal Simulation Wage Areas and Wage Indices by Hospital.....	238
Endnotes .....	252

RE: Medi-Cal DRG Project: Policy Design Document

Dear Mari:

It is my pleasure to submit this Policy Design Document with our recommendations for the new hospital inpatient payment method, per the revised Statement of Work dated December 23, 2011 (FI letter A-1104).

Readers should bear in mind that this document reflects our recommendations and not necessarily decisions by the Department of Health Care Services. Our emphasis is on the structure of the payment method. Based on history in California and elsewhere, this payment method could remain in place for 10, 20 or more years. It is therefore designed to be flexible in accommodating future policy decisions. In particular, nothing in this document specifies the levels of payment that will be made for specific medical conditions or to specific hospitals when the new method is implemented. Throughout this document, occasional “call-out” boxes identify the policy decisions and rate-setting tasks that remain to be finalized. We will continue to advise and assist the Department in making these decisions and setting these rates. I should also note that all discussion of federal and state law is from a policy analyst’s perspective and is not legal advice to the Department.

In preparing this document, we have greatly benefited from advice and assistance from many state staff, as listed below. We would like to particularly thank the project manager, Mark Sanui, as well as Nathan Davis, Dr. Robert Dimand, Dr. Laura Ann Halliday, Robert Kvick, William Lau, Jan Rains, Richard Sanchez, Becky Swol, Elizabeth Touhey, Pilar Williams and you. At the initiation of the project, our instructions from Medicaid Director Toby Douglas were to run a very transparent and consultative development process. Input and suggestions from the consultation group convened by the California Hospital Association have been very helpful indeed. We thank Matt Absher, Anne McLeod and the many hospital executives who gave their time to this effort. We note, of course, that not everyone who participated in the workgroup and the consultation group agrees with our recommendations. On several topics in this document, we have presented alternative options for the Department’s consideration.

Much of our analysis was illuminated by review of paid claims in CY 2009. The analytical dataset, and a subset that became the simulation baseline dataset, are fully described in a separate report, *Medi-Cal DRG Project: Summary of Analytical Dataset* (December 2011). We also would like to acknowledge our use of APR-DRG grouping software created, owned and licensed by the 3M Company. We very much appreciate

the assistance provided by Jack Ijams, Elizabeth McCullough, Richard Fuller and their colleagues at 3M Health Information Systems, but we emphasize that 3M bears no responsibility for the judgments we have made in using the 3M software.

Anyone with questions may feel free to contact me at 262.365.3592 or dawn.weimar@acs-inc.com.

Sincerely,

Dawn Weimar, RN, CORA  
Project Director

# Acronyms

ALOS	Average length of stay
APR-DRGs	All Patient Refined Diagnosis Related Groups. APR-DRGs are proprietary software created, owned and licensed by the 3M Company. All copyrights in and to the 3M™ Software are owned by 3M. All rights reserved.
CA-MMIS	California Medicaid Management Information System, which is the Medi-Cal claims processing system
CC	Complications and comorbidities
CCR	Cost-to-charge ratio
CCS	California Children’s Services. This program is a partnership between local county health departments and DHCS Children’s Medical Services, providing health care services to children from birth up to 21 years of age with CCS-eligible medical conditions
CHA	California Hospital Association
CMAC	California Medical Assistance Commission. The state agency that contracts and negotiates per diem rates with hospitals under the Medi-Cal SPCP
CMS	Centers for Medicare and Medicaid Services
CY	Calendar year
DHCS	Department of Health Care Services
DPH	Designated public hospital
DRG	Diagnosis related groups
DSH	Disproportionate share hospitals
EDI	Electronic data interchange
ER	Emergency room
FAQ	Frequently asked questions
FDOS	First date of service
FFS	Fee for service
FFY	Federal fiscal year
GHPP	Genetically Handicapped Persons Program
HACs	Hospital-acquired conditions
HCACs	Health care-acquired conditions
HCPCS	Healthcare Common Procedure Coding System
HFMA	Healthcare Financial Management Association
HSCRC	Maryland Health Services Cost Review Commission
ICD-10-CM	International Classification of Diseases, 10 <sup>th</sup> Edition, Clinical Modification
ICD-10-PCS	International Classification of Diseases, 10 <sup>th</sup> Edition, Procedure Coding System
IPPS	Medicare’s Inpatient Prospective Payment System
LDOS	Last date of service
MACPAC	Medicaid and CHIP Payment and Advisory Commission, a Congressional agency
Medi-Cal	The California Medicaid program
MedPAC	Medicare Payment Advisory Commission, a Congressional agency
MEDPAR	Medicare Provider Analysis and Review
MMIS	Refers to the CA-MMIS claims payment system
MS-DRGs	Medicare Severity Diagnosis Related Groups
NCD	National Coverage Determination memoranda
OHC	Other health coverage
OSHPD	California Office of Statewide Health Planning and Development

POA	Present-on-admission indicator
PDD	Policy design document, that is, this document
PPACA	Patient Protection and Affordable Care Act
SAR	Service authorization request
SFY	State fiscal year
SNFD	Safety Net Financing Division, a division within DHCS
SOC	Share of cost
SPCP	Selective provider contracting program, that is, the payment method for the Medi-Cal program prior to APR-DRG implementation
TAR	Treatment authorization request
TBD	To be determined
TOB	Type of bill, a field on the standard UB-04 inpatient claim form
VA	Veterans Administration

# Summary: Policy Design Components

#	Item	Description
<b>1</b>	<b>Scope of Payment Method</b>	
1.1	Goals of the project	Design a new payment method for hospital inpatient care based on Diagnosis Related Groups (DRGs).
1.2	Time horizon	The new payment method can be expected to be in place for 10 to 20 years or more. The payment method structure must be robust, readily updated, and flexible enough to accommodate future changes in payment policy.
1.3	Principles in recommending payment policy	<p><u>Access</u>: Encourage access by setting higher payments for sicker patients.</p> <p><u>Efficiency</u>: Reward efficiency by allowing hospitals to retain savings from decreased LOS and decreased cost per day.</p> <p><u>Transparency</u>: Improve transparency and understanding by defining the “product” of a hospital in a way that makes sense to both clinical and financial managers.</p> <p><u>Fairness</u>: Improve fairness so that (a) different hospitals receive similar payment for similar care and (b) payments to hospitals are adjusted for significant cost factors that are outside the hospital’s control.</p> <p><u>Administrative ease</u>: Make changes in a way that reduces administrative burden on hospitals and Medi-Cal.</p> <p><u>Data integrity</u>: Make payment depend on data inputs that have high consistency and credibility.</p> <p><u>Simplicity</u>: In modern health care, a virtue in itself.</p> <p><u>Quality</u>: Facilitate improvement of quality and outcomes.</p>
1.4	Key dates	<ul style="list-style-type: none"> <li>Analytical dataset: 12/22/11</li> <li>Final policy design document: 4/25/12</li> <li>Implementation: 01/01/13</li> </ul>
1.5	Previous payment method	<p><u>Non-contracted hospitals</u>: A cost-based method with payments made on an interim basis (cost-to-charge) and a cost settlement process</p> <p><u>SPCP or contracted hospitals</u>: Per diem rates negotiated with the California Medical Assistance Commission (CMAC)</p>
1.6	Affected providers	<p><u>Included</u>: in-state and out-of-state general acute care hospitals, including critical access hospitals</p> <p><u>Excluded</u>: designated public hospitals, psychiatric hospitals, rehabilitation hospitals (including alcohol and drug rehabilitation) and rehabilitation units at general hospitals.</p>
1.7	Affected claims	<p><u>Included</u>: All inpatient claims in general acute care hospitals</p> <p><u>Excluded</u>: psychiatric stays, rehabilitation stays (physical rehabilitation and alcohol and drug rehabilitation), swing bed stays, managed care stays, administrative days and Medicare crossovers</p>
1.8	Beneficiaries with dual eligibility	<p><u>Crossover claims</u> flow through the DRG grouping and pricing logic in order to calculate the allowed amount payable by Medi-Cal and used in comparative pricing.</p> <p><u>Medicaid primary claims</u> for beneficiaries with dual eligibility will be paid like other claims where Medi-Cal is primary.</p>

#	Item	Description
1.9	Out-of-state claims	Claims from out-of-state hospitals will be included in the DRG-based payment in the same way as California hospitals, with negotiated payment in extremely rare situations where complex medical services and surgical procedures otherwise would be unavailable.
1.10	Hospice	<u>Excluded</u> : Inpatient hospice (provider type 39)
1.11	Affected programs	<u>Included</u> : all Medi-Cal fee-for-service, CCS only, GHPP only.
1.12	Medi-Cal managed care	“Rogers Rates” will no longer be applicable. We expect that the plans will pay hospitals for out-of-network emergency care based on the fee-for-service DRG payment method.
1.13	Analytical dataset and simulation dataset	<ul style="list-style-type: none"> <li>• Calendar year 2009 (January – December 2009).</li> <li>• Database consists of claims payment data from CA-MMIS and diagnosis/procedure data from OSHPD data.</li> <li>• Analytical Dataset: 538,470 stays, approximately 3.5 billion in payments.</li> <li>• Simulation baseline dataset: 446,715 stays, approximately \$2.6 billion in payments.</li> </ul>
<b>2</b>	<b>Casemix Measurement and Relative Weights</b>	
2.1	Overview of DRG payment calculations	This section is a general discussion of DRG pricing principles, not specific to California.
2.2	Casemix measurement	Measured using All Patient Refined Diagnosis Related Groups (APR-DRG) software.
2.3	DRG grouper version	<ul style="list-style-type: none"> <li>• Version 29 (released in 10/2011), which has been used for analysis and simulation, would be implemented January 1, 2013</li> <li>• Version 31 recommended for July 1, 2014, to be used with ICD-10 to ICD-9 crosswalk until new CA-MMIS is operational</li> <li>• Recommendation for annual updates each July 1 thereafter</li> </ul>
2.4	ICD-10 impact	APR-DRGs to be implemented before ICD-10. When ICD-10 is implemented, the ICD-10 code values will be crosswalked to ICD-9 values that will be input to the DRG grouper. The new payment method will transition to an ICD-10-supported version of the APR-DRG grouper with CA-MMIS Health Enterprise implementation in 2016.
2.5	Relative weights	The national weights do fit the Medi-Cal data well. We recommend that the Department adopt the national weights calculated by 3M for the APR-DRG grouper
2.6	Policy adjustor functionality	We recommend that the DRG design include functionality for policy adjustors. Specification of policy adjustors, if any, will be determined before implementation.
2.7	Age adjustor functionality	We recommend that the DRG design include functionality for age adjustors. Specification of age adjustors, if any, will be determined before implementation.
2.8	Updating relative weights and policy adjustors	We recommend that relative weights be updated at the same time as the DRG grouper is updated. If policy adjustors or age adjustors are used, we recommend that they be reviewed annually to determine whether they remain appropriate.
<b>3</b>	<b>DRG Base Price</b>	
3.1	DRG base price	We recommend variation of the DRG base price based on Medicare wage areas and California’s definition of remote rural hospitals. Calculation of the hospital DRG base prices for 2013 and the remote rural hospital list will be decided before implementation.

#	Item	Description
3.2	Budget target	The DRG payment method will be implemented on a budget-neutral basis by California statute.
3.3	Variations in the DRG base price by wage areas	<p><u>Wage areas</u>: Adopt the Medicare assignment of hospitals to specific wage areas, including reclassifications of hospitals into adjacent wage areas.</p> <p><u>Wage index</u>: Use the same wage area index values for each hospital as Medicare does. For hospitals where Medicare does not show a specific value, use the wage area corresponding to the hospital's physical location. For out-of-state hospitals, use the Medicare national value of 1.00.</p>
3.4	Variations in the DRG base price by hospital characteristics	<p>Remote rural hospitals will receive a higher DRG base price.</p> <p><u>Definition</u>: "A rural hospital, at least 15 miles in driving distance from the nearest general acute care hospital that has at least a basic level emergency room."</p> <p>The remote rural hospital list will be finalized prior to implementation. Designated NICU hospitals may benefit from a higher neonate policy adjustor.</p>
3.5	Documentation, coding and capture adjustment	<p>We recommend that Medi-Cal include an adjustment to the DRG base price in anticipation of improved documentation and coding by hospitals, as follows.</p> <ul style="list-style-type: none"> <li>• Set the documentation, coding and capture adjustment</li> <li>• Expect real casemix change, e.g., 0.5% per year (2009-2013)</li> <li>• Set a casemix corridor and value to increase or decrease the DRG base price depending on the difference between the expected and reported casemix</li> <li>• Adjust DRG base prices prospectively, if possible.</li> <li>• Provide advance notice to hospitals of measured casemix</li> <li>• Monitor casemix changes through claims analysis</li> </ul>
3.6	Transition base prices	We recommend a three-year transition to be budget-neutral overall and operationalized by adjusting the hospital-specific DRG base price.
<b>4</b>	<b>Other Factors in Payment</b>	
4.1	Transfer adjustments	<p>If a patient transferred to an acute care setting means that the length of stay at the transferring hospital is unusually low, we recommend reducing payment to a per diem based on the DRG as follows.</p> <ul style="list-style-type: none"> <li>• <u>Acute care transfers</u>: Use the Medicare formula to reduce payment to a per diem. Unlike Medicare, we recommend inclusion of discharge statuses 02, 05, 65 and 66 as discharges that would qualify as an acute care transfer.</li> <li>• <u>Post-acute care transfers</u>: No Medicare-style transfer policy for post-acute care due to the very different patient characteristics of the Medicare and Medicaid populations</li> </ul> <p>Payment adjustment only applies to the transferring hospital. The receiving hospital is paid the full DRG amount.</p>

#	Item	Description
4.2	DRG outlier payment adjustments	<p>Recommended that Medi-Cal adopt a DRG cost outlier adjustment policy as follows:</p> <p><u>Cost outlier-high side</u>: A stay qualifies as a cost outlier-high side if the hospital's estimated loss on the stay exceeds a threshold</p> <p><u>Cost outlier- low side</u>: A stay qualifies as a cost outlier-low side if the hospital's estimated gain on the stay exceeds a threshold</p> <ul style="list-style-type: none"> <li>• For high side outliers, the outlier payment would equal 60% of the difference between estimated loss and the threshold, plus 80% of the loss above a second threshold</li> <li>• Estimated hospital cost = (Charges x hospital-specific cost-to-charge ratio)</li> <li>• Marginal cost factor at 60%, or 80% for losses above a second threshold</li> </ul>
4.3	Add-on payments functionality	We recommend that the payment method include functionality for a hospital-specific add-on payment to be added for each stay. Such add-on payments can be used, for example, in paying for capital, DSH, medical education, or quality incentives. There are no plans to use this field initially.
4.4	Partial eligibility	<ul style="list-style-type: none"> <li>• Hospitals would bill Medi-Cal with occurrence codes A2 or A3 which would trigger the partial eligibility adjustment.</li> <li>• Recommend an adjustment to the DRG payment in cases of partial eligibility.</li> <li>• No changes to how CA-MMIS interfaces with the eligibility system.</li> </ul>
4.5	Other health coverage and share of cost	Other health care coverage payments and share-of-cost would continue to be applied under the new payment method as is currently done.
4.6	Supplemental payments	Supplemental payments are outside the scope of the DRG payment method.
4.7	Separately payable services, supplies and devices	<p>Continue to use existing CA-MMIS functionality that allows separate payment on an outpatient claim for certain services, supplies and devices during an inpatient stay.</p> <p>Recommend a short list of specific HCPCS codes regardless of the treating hospital.</p> <p>The specific list of separately payable services, supplies, and devices will be defined prior to implementation.</p>
4.8	Newborn hearing screening	Implementation of DRG payment would have no effect on this screening program.
4.9	Negotiated payments	Enable flexibility for the Department to negotiate payment arrangements in truly exceptional circumstances.

#	Item	Description
4.10	Pay for quality	<ul style="list-style-type: none"> <li>Recommended compliance with minimum federal requirements for health care-acquired conditions and erroneous surgeries.</li> <li>Collect the present-on-admission indicator (POA) values on diagnoses.</li> <li>Use 3M™ Hospital-acquired Condition (HAC) Utility supplied with the APR-DRG grouper to identify and remove Medicaid HCAC diagnoses from claims based on the POA.</li> <li>Identify erroneous surgeries based on diagnosis codes E8765, E8766, and E8767 and set edit to suspend to the fiscal intermediary for manual review and potential disallowance of payment.</li> <li>Include functionality to allow exceptions to the HCAC pricing logic for a DHCS-defined list of pediatric HCAC categories.</li> <li>Consider opportunities for future pay for quality initiatives, e.g., PPCs, PPRs or state-defined measures.</li> </ul>
<b>5</b>	<b>Treatment Authorization, Coding and Billing</b>	
5.1	Treatment authorization request	<ul style="list-style-type: none"> <li>Continue to require TAR on the medical necessity of the admission, including CCS and GHPP admissions.</li> <li>Discontinue TAR on the length of stay and on days of care related to induction of labor</li> <li>Continue TAR on non-obstetric procedures provided to beneficiaries with restricted Medicaid eligibility.</li> <li>Continue to require TAR on both the admission and the length of stay for administrative days, hospice, and rehabilitation.</li> </ul>
5.2	Late charges and interim claims	<p><u>Late charges:</u> Disallow claims for late charges (bill type 115).</p> <p><u>Interim claims:</u></p> <ul style="list-style-type: none"> <li>Accept interim claims for stays with length of stays exceeding 30 days with bill type 112, 113 and with patient discharge status 30. Payment based on a statewide per diem rate. Claims can be submitted in additional increments of 31 days.</li> <li>When patient is discharged, hospital to adjust interim claim and submit a single admit-through-discharge claim.</li> <li>Deny bill type 114.</li> </ul>
5.3	Related outpatient services	Continue previous policy to include related outpatient services within the definition of an inpatient stay.
5.4	Administrative days	<ul style="list-style-type: none"> <li>Continue previous policy to pay for administrative days at per diem rates, subject to TAR. Identify these stays with revenue code 169 and designate them as Level 1 administrative days.</li> <li>Implement a new “Level 2” administrative day policy for patients whose needs are higher than Level 1 but, nevertheless, subacute. Identify these stays with revenue code 199.</li> </ul>
5.5	Rehabilitation stays	<ul style="list-style-type: none"> <li>Identify a “rehabilitation” stay by the presence of an accommodation revenue code for rehabilitation (e.g., 118, 128, 138, 148, 158)</li> <li>Set payment based on a single statewide all-inclusive per diem method</li> <li>Require TAR for the admission and all days.</li> </ul>
5.6	Remittance advice	Provide the four-digit APR-DRG code and a remittance and remark code for payment reduction due to a health care-acquired condition. Additional impacts to paper and electronic remittance advice to be identified as part of the systems requirements and analysis phase.

#	Item	Description
5.7	Billing and eligibility for newborns	<ul style="list-style-type: none"> <li>Require separate claims for the mother and the newborn(s). Disallow claims that include revenue codes for nursery and for labor and delivery in the same claim.</li> <li>Remove TAR on the length of stay and induction of labor.</li> <li>Continue to submit claims under either the baby's benefits identification card (BIC) or the mother's card.</li> </ul>
5.8	Per diem rates	<ul style="list-style-type: none"> <li>Develop per diem rates for interim claims, administrative day level 2, and rehabilitation.</li> <li>Continue previous payment policy for hospice and administrative day level 1 and separately payable services, supplies and devices. This list will be determined prior to implementation.</li> </ul>
<b>6</b>	<b>Implications for Hospitals and DHCS</b>	
6.1	Frequently asked questions	An FAQ document is available through the Medi-Cal website at <a href="http://www.dhcs.ca.gov">www.dhcs.ca.gov</a> .
6.2	DRG pricing calculator	The DRG pricing calculator is a spreadsheet tool used for both hospital training and MMIS testing to demonstrate how the pricing logic works. This section includes pricing examples.
6.3	Expected impacts on hospitals	This section summarizes the DRG payment method's impact on hospital operations and finances.
6.4	Policy documentation	Policy documentation for the new payment method is expected to include updates to regulations, the Medicaid state plan and the provider billing manual. Xerox will assist DHCS in the preparation of policy documentation.
6.5	Policy update and file maintenance tasks	This section summarizes the recommended tasks (periodic reviews, updates and maintenance) essential to the proper functioning of any DRG-based payment method.
6.6	Monitoring payment method integrity	This section provides a suggested approach, reports, and associated tasks to monitor the integrity of the new payment method after implementation.
6.7	Implications for growth in hospital cost	Payment by DRG is expected to reduce the growth rate in hospital cost by creating financial rewards for controlling length of stay and cost per day.
<b>7</b>	<b>Business Requirements for CA-MMIS Changes</b>	
7.1	Summary of requirements	This section summarizes the business requirements for CA-MMIS changes.
7.2	Reference data system	This section lists the system parameters, system lists, and field edits needed in CA-MMIS.
7.3	Provider master file	This section identifies the new provider master file fields and associated business data validation rules.
7.4	TAR data entry – SURGE and SARS	This section identifies the TAR entry business requirements.
7.5	Inpatient claim data entry	This section identifies the inpatient claim data entry business requirements (e.g., additional diagnosis and procedure codes and occurrence codes).
7.6	Adjudication edits	This section identifies the business requirements for claim data edits (e.g., validity edits, HCAC and erroneous surgery edits, pricing parameter edits, DRG grouping edits, and other edits)

#	Item	Description
7.7	Claims pricing	This section identifies the claims pricing business requirements.
7.8	Processing final claim after interim claims	This section identifies the business requirements for voiding interim claims when the final claim for a long hospital stay is adjudicated.
7.9	Reporting DRG pricing information	This section identifies the business rules for changes to the remittance advice, DRG pricing reports, and data warehouse extracts.
7.10	Database changes	This section identifies new files and fields that will need to be added to the CA-MMIS database.
7.11	Data configuration	This section identifies the data configuration tasks to be performed in testing and production environments prior to implementation.
7.12	Unresolved requirements	This section identifies the business requirements for handling DRG payment of CCS and non-CCS payment on a single hospital stay.
7.13	Payment policy flowchart	This section describes the DRG pricing method in the form of a flowchart.

# 1 Scope of Payment Method

## 1.1 Goals of the Project

In proposing a new payment method for hospital inpatient services provided to Medi-Cal beneficiaries based on diagnosis related groups (DRGs), the California Department of Health Care Services' goals are to:

- Design and implement the provisions described in §14105.28 that were added to the Welfare and Institutions Code by the 2009-2010 Legislature under Senate Bill 853<sup>1</sup>
- Replace the previous method of negotiated rates with a method based on All Patient Refined Diagnosis Related Groups (APR-DRGs)
- Encourage access to care, reward efficiency, improve transparency, and improve fairness by paying similarly across hospitals for similar care
- Simplify the payment process, encourage administrative efficiency and base payments on consistent and credible data
- Facilitate implementation of State and federal provisions related to health care-acquired conditions, and
- Support provider compliance with State and federal requirements

## 1.2 Time Horizon

Based on experience in California and other states and at the federal level, the new payment method can be expected to be in place for 10, 20 or more years. It is therefore essential that it be flexible enough to accommodate a wide range of changes in future payment policy. We can't know what these will be, but we can make educated guesses based on experience in California and elsewhere.

At the same time, it is important to keep the design of the payment method as simple as possible. One reason is that there is too much complexity already in health care payment, so any added complexity should result in a clear benefit. A second reason is that added complexity increases costs for both hospitals and the Medi-Cal claims processing system, which is known as the California Medicaid Management Information System (CA-MMIS).

One consequence of designing a payment method expected to be in place for many years is that the structure itself should not be contentious, precisely because it should

accommodate a wide range of payment policy choices. For example, we propose a structure that accommodates both a single default DRG base price as well as hospital-specific base prices. That means that the question of whether different DRG base prices should be paid to different hospitals can be deferred. Another example is that we propose functionality to allow hospital-specific “add-on” payments on each claim that are separate from the DRG payment. This field could be used to make payments for medical education, capital, pay-for-quality incentives, or for other purposes. If such add-on payments are needed, then the functionality is there. If add-on payments are not needed, then the data field is simply filled with zeroes.

## 1.3 Principles in Recommending Payment Policy

As a guide to making payment policy recommendations, we propose to use the following principles. Although trade-offs are inevitable, we find it useful to explicitly list the principles. The list includes a few comments on how these guiding principles can affect payment by DRG.

- **Access.** In practice, this means paying more for patients who need more care and paying less for patients who need less care. If payment is too low for acutely ill patients, then hospitals are penalized for treating those patients and will seek to avoid them, especially over time as decisions are made about capital spending and what services to offer. And if payment is too high for low-acuity patients, then these patients are inappropriately profitable for hospitals. Issues of access are particularly pertinent when Medicaid represents a large percentage of total volume for a particular category of care, such as neonatology, pediatrics, and obstetrics.

DRG payment is generally viewed as facilitating access to care because payment is appropriate to the illness burden or severity of the patient’s condition, resulting in payment that is higher for higher-acuity patients. The DRG algorithm must, however, be appropriate for the patient population, as we will see in Section 2.2. The access criterion also helps explain why DRG payment methods include outlier payment provisions for patients who are extraordinarily and unpredictably expensive.

- **Efficiency.** The question here is whether a payment method specifically and predictably rewards hospitals that increase efficiency, other things equal. The classic example is the Medicare implementation of DRGs in 1983, which prompted significant reductions in length of stay and in the growth rate of cost per day.<sup>2</sup> When designing particular features of a DRG payment method, it is therefore important to minimize reliance on hospital-specific costs or charges. The outlier payment feature is a good example of how the access and efficiency criteria must be balanced to accomplish objectives. See Section 4.2.
- **Transparency.** Recent years have seen increasing interest among hospitals, patients, and government in increasing transparency in charges and payments. DRGs enable this transparency by defining the “product of a hospital,” that is, by organizing the immense complexity of modern inpatient care into a manageable number of groups that are similar both clinically and financially. DRGs enable “clinical conversations” about practice patterns within hospital walls between

clinicians and financial managers. Medi-Cal use of DRGs would have the most impact in those areas where Medicaid is a major payer, such as obstetric and pediatric care.

In California, implementation of DRGs would also promote transparency in that the previous method of confidential hospital-specific rates would be replaced by a system of published rates by DRG, typically available for all to view on the Internet.

- **Fairness.** Fairness has two primary meanings. First, different hospitals would receive similar payment for similar care, which is widely considered a major benefit of DRG payment. Second, payment rates would be adjusted for factors outside the hospital's control. Medicare, for example, includes wage area adjustments in an effort to be fair to hospitals in high wage areas. In practice, and as Medicare's experience has demonstrated, it can be quite contentious to precisely define "factors outside the hospital's control."
- **Administrative ease.** Implementing a new payment method is a major initiative for both hospitals and a Medicaid program. That said, well designed and well implemented methods are easier for everyone than the alternative. For hospitals, the major potential impacts are on medical coding, billing, and information systems. In addition, payment methodology may also influence the coordination of care from admission to discharge. For Medi-Cal, the major impact would be on the CA-MMIS. In all areas, simplicity is paramount. Complexity should be added to a payment method only if it results in substantial improvements to one of the other criteria. It also helps if existing business processes within both the hospitals and the state agency continue to be used to the fullest extent possible.
- **Data integrity.** All payment methods depend on incoming data, and all data have issues. Ideally, data used to calculate payment should be specific, verifiable, relevant and consistently defined. DRG payment relies heavily on diagnosis and procedure coding and to a lesser extent on hospital-specific charges and costs. Complete documentation of diagnosis and procedure codes is essential to accurate DRG assignment and, therefore, payment.
- **Quality.** Very few payment methods specifically reward quality care; indeed, many methods, including DRGs, can reward poor quality if poor quality results in more care being provided. Although pay-for-quality initiatives are not the focus of this project, the design of the payment method should facilitate quality measurement and incentives where possible. In particular, any initiative to measure and reward quality must include careful adjustment for casemix differences among patients and hospitals. In addition, DRG payment will enable compliance with new federal requirements to adjust payments for certain health care-acquired conditions.

## 1.4 Key Dates

Project milestone dates in Table 1.4.1 were originally set on the assumption of a July 1, 2012, implementation date, which has since been revised to January 1, 2013. Dates may be changed through written correspondence between the project managers.

<b>Project Milestone</b>	<b>Date</b>
Start work	4/8/2011
Receive sample inpatient hospital dataset	4/1/2011
Project kick-off meetings	Week of 4/25/11
Delivery of first draft of Policy Design Document (PDD)	5/17/2011
Delivery of second draft of PDD	6/14/2011
Department acceptance of first draft of PDD	6/22/2011
Department acceptance of second draft of PDD	6/22/2011
Receive full calendar year inpatient hospital dataset	7/14/2011
Delivery of Analytical Dataset Summary-draft	8/18/2011
Delivery of third draft of PDD	8/26/2011
Department acceptance of third draft of PDD	8/30/2011
Delivery of Analytical Dataset Summary-draft	9/23/2011
Delivery of fourth draft of PDD	9/23/2011
Department acceptance of fourth draft of PDD	9/27/2011
Delivery of Analytical Dataset Summary-draft	10/20/2011
Delivery of fifth draft of PDD	10/20/2011
Department acceptance of fifth draft of PDD	10/27/2011
Contractor delivers sixth draft of PDD	12/6/2011
Department acceptance of sixth draft of PDD	12/23/2011
Department acceptance of Analytical Dataset Summary	12/23/2011
Contractor delivers seventh draft of PDD	1/10/2012
Department acceptance of seventh draft of PDD	1/26/2012
Contractor delivers final draft of PDD	2/23/2012
Contractor delivers final PDD	4/25/2012
Department acceptance of final PDD	4/30/2012
Contractor delivers policy documentation	5/10/2012
Department acceptance of policy documentation	5/20/2012
Contractor delivers policy-oriented test scenarios	7/15/2012
Department acceptance of policy-oriented test scenarios	7/25/2012
Department delivers PDD with revisions resulting from implementation work	12/10/2012
Department acceptance of PDD with revisions resulting from implementation work	12/20/2012
Contractor delivers analysis of potentially preventable complications	TBD
Department acceptance of analysis of potentially preventable complications	TBD
New payment method effective	1/1/2013

# 1.5 Previous Payment Method

Medi-Cal’s previous payment method for hospital inpatient services was based generally on two distinct methods.

- Selective Provider Contracting Program (SPCP) or contract hospital rates.**  
 This payment method was established legislatively in 1982 and operates under a federal waiver.<sup>3</sup> The California Medical Assistance Commission (CMAC) contracts and negotiates per diem rates with hospitals under the Medi-Cal SPCP. Hospitals may have one or more rates depending on the services offered and the contract terms. The hospital contracted and supplemental rates are confidential for a period of four years.<sup>4</sup>
- Non-contract hospital rates.** Non-contract hospitals are reimbursed based on Medi-Cal allowable, audited costs. Hospitals are paid interim rates using a cost-to-charge ratio that is based on the most recently submitted cost report as reported. A cost settlement process reconciles the difference between interim payments and the costs of providing services. DHCS has a three-year period to complete the audit process.<sup>5</sup>

In addition, rates for 21 designated public hospitals are established by DHCS based on the certified public expenditures process. Designated hospitals are outside the scope of the new payment method.

Table 1.5.1 shows that the SPCP payment method accounted for 77 percent of total Medi-Cal stays and payments made to general acute care hospitals in CY 2009.

	Nbr of Hosp	Stays	Days	Charges	Est. Cost	Baseline Payments	Case mix	Cost / Chg	Pay / Cost	Avg LOS	Avg Chg	Avg Cost	Avg Pay
Contract hospitals	178	415,416	1,811,040	\$16,427,965,128	\$3,690,807,040	\$2,522,841,240	0.72	22%	68%	4.4	\$39,546	\$8,885	\$6,073
Non-contract hospitals	173	120,903	401,327	\$3,490,630,091	\$923,252,468	\$923,252,468	0.62	27%	100%	3.3	\$28,871	\$7,636	\$7,636
Out-of-state hospitals	254	2,151	11,304	\$78,656,721	\$17,304,479	\$17,304,479	0.66	22%	100%	5.3	\$36,568	\$8,045	\$8,045
<b>Total</b>	<b>605</b>	<b>538,470</b>	<b>2,223,671</b>	<b>\$19,997,251,939</b>	<b>\$4,631,363,987</b>	<b>\$3,463,398,187</b>	<b>0.70</b>	<b>23%</b>	<b>75%</b>	<b>4.1</b>	<b>\$37,137</b>	<b>\$8,601</b>	<b>\$6,432</b>

**Notes:**

- Data are the responsibility of Xerox and should not be attributed to any California state agency.
- This table is based on the analytical baseline dataset for CY 2009. Other tables in this document are based on the simulation baseline dataset. See Section 1.13.
- Payment figures exclude supplemental payments.
- Designated public hospitals are excluded.
- Some hospitals are counted under both contract and non-contract categories because their status changed during calendar year 2009.
- Casemix is measured using national relative weights for APR-DRG V.29.

## 1.6 Affected Providers

Included in the scope of the new payment method are general acute care hospitals, including hospitals designated by Medicare as critical access hospitals. These hospitals include in-state and out-of-state facilities that submit fee-for-service claims for inpatient hospital services provided to Medi-Cal beneficiaries.

The following hospitals are outside the scope of the DRG payment method:

- Psychiatric hospitals and psychiatric units at general hospitals
- Rehabilitation hospitals and rehabilitation units at general hospitals, including alcohol and drug rehabilitation hospitals
- Designated public hospitals
- Inpatient hospice

General acute care hospitals are identified as provider types 16 and 60 and include designated public hospitals (DPHs). DPHs are further identified based on their national provider identifier. Because designated public hospitals are outside the scope of DRG payment, they have been excluded from the analytical dataset used to develop the DRG method. In addition, Indian Health Services hospitals (provider type 75) are excluded from the DRG payment method.

General acute care hospitals as defined in the claims processing system also include hospitals that self-identify as rehabilitation hospitals as well as rehabilitation units within general hospitals. See Section 5.5 regarding payment for rehabilitation stays.

## 1.7 Affected Claims

Within general acute care hospitals, the DRG payment method will apply to hospital inpatient claims submitted on the UB-04 claim form and ANSI ASC X12N 837 institutional transaction.

- **Included:** All inpatient claims in general acute care hospitals are in the scope of the project
- **Excluded:** Psychiatric stays, rehabilitation stays (including alcohol and drug rehabilitation), swing-bed stays, managed care stays, and administrative days

In general, psychiatric care and chemical dependency are outside the scope of the DRG project, because these services are covered and paid by the counties. Nevertheless, there were a small number of mental health and chemical dependency claims in the 2009 simulation baseline dataset paid by DHCS. We recommend payment by DRG for these few stays. See Table 1.7.1.

While rehabilitation stays also represent a small percentage of total claims in the dataset, we recommend special consideration for these claims. Please see Section 5.5.

Table 1.7.1

## Summary of Physical Rehabilitation and Mental Health/Chemical Dependency Stays

Hospitals	Stays	Days	Charges	Est Cost	Baseline Payment	Cost / Chg	Pay / Cost	Avg LOS	Avg Chg	Avg Cost	Avg Pay
<b>Physical Rehabilitation</b>											
California hospitals	1,231	31,375	\$139,040,715	\$32,501,197	\$38,017,051	23%	117%	25.5	\$112,949	\$26,402	\$30,883
Out-of-state hospitals	9	70	\$257,469	\$56,643	\$56,643	22%	100%	7.8	\$28,608	\$6,294	\$6,294
<b>Subtotal</b>	<b>1,240</b>	<b>31,445</b>	<b>\$139,298,184</b>	<b>\$32,557,840</b>	<b>\$38,073,694</b>	<b>23%</b>	<b>117%</b>	<b>25.4</b>	<b>\$112,337</b>	<b>\$26,256</b>	<b>\$30,705</b>
<b>Mental Health/Chemical Dependency</b>											
California hospitals	837	2,600	\$25,266,984	\$5,988,514	\$5,016,349	24%	84%	3.1	\$30,188	\$7,155	\$5,993
Out-of-state hospitals	31	248	\$687,530	\$151,257	\$151,257	22%	100%	8.0	\$22,178	\$4,879	\$4,879
<b>Subtotal</b>	<b>868</b>	<b>2,848</b>	<b>\$25,954,514</b>	<b>\$6,139,771</b>	<b>\$5,167,606</b>	<b>24%</b>	<b>84%</b>	<b>3.3</b>	<b>\$29,902</b>	<b>\$7,073</b>	<b>\$5,953</b>
<b>Total Stays</b>	<b>2,108</b>	<b>34,293</b>	<b>\$165,252,698</b>	<b>\$38,697,611</b>	<b>\$43,241,300</b>	<b>23%</b>	<b>112%</b>	<b>16.3</b>	<b>\$78,393</b>	<b>\$18,358</b>	<b>\$20,513</b>
<b>Total Medi-Cal Stays</b>	<b>446,715</b>	<b>1,732,336</b>	<b>\$14,508,005,748</b>	<b>\$3,422,225,747</b>	<b>\$2,632,095,148</b>	<b>24%</b>	<b>77%</b>	<b>3.9</b>	<b>\$32,477</b>	<b>\$7,661</b>	<b>\$5,892</b>
<b>% of Total</b>											
<b>Medi-Cal Stays</b>	<b>0.5%</b>	<b>2.0%</b>	<b>1.1%</b>	<b>1.1%</b>	<b>1.6%</b>						
<i>Notes:</i>											
1 Rehab stays were defined by (A) all claims that grouped to APR-DRG 850 and 860, or (B) had a principal diagnosis code of V57.0, V57.1, V57.21, V57.22, V57.3, V57.4, V57.81, or (C) had diagnosis codes V57.89 or V57.9 or had procedure codes 93.85 or 93.89 anywhere on the claim. See Section 5.5 for the definition to be used going forward.											
2 Mental health/chemical dependency stays were defined by all claims that grouped to APR-DRGs 750-760 or 770-776.											
3 This table is based on the simulation baseline dataset.											

## 1.8 Beneficiaries with Dual Eligibility

Many beneficiaries are dually eligible for Medicare and Medi-Cal, a situation sometimes referred to as “Medi-Medi.” In general, Medicare is the primary payer for inpatient hospital care and Medi-Cal is the secondary payer. For these Medicare crossover claims, Medi-Cal policy is to pay the lower of two amounts.<sup>6</sup>

- Amount 1 = The sum of the Medicare deductible, Medicare blood deductible, and Medicare coinsurance
- Amount 2 = The amount that Medi-Cal would have paid if Medi-Cal had been the primary payer, minus the amount already paid by Medicare

This policy, known as comparative pricing in California, is followed by many states.<sup>7</sup>

In 2009, there were 193,864 crossover claims. The total Medicare deductible and coinsurance amount was \$256.8 million.<sup>8</sup> For 38,394 claims (20 percent of the total), Medi-Cal paid Amount 1, that is, the full deductible and coinsurance. For 155,137 claims (80 percent), Amount 2 was lower, so Medi-Cal paid less than the full deductible and coinsurance. For the remaining 333 claims, the Medicare deductible and coinsurance amount was zero. Total Medi-Cal payment on all crossovers was \$80.7 million. These claims and payments are excluded from the simulation dataset used to develop the DRG method.<sup>9</sup>

Under DRG payment, crossover claims would continue to be priced using comparative pricing. Crossover claims would flow through the DRG grouping and pricing logic in order to calculate Amount 2.

In 2009, Medi-Cal also paid for 29,755 stays where the patient had dual eligibility but Medicare was not the primary payer. This can occur because the patient did not have Medicare Part A coverage or because the Medicare inpatient hospital benefit had been exhausted. Total charges were \$2.08 billion, estimated hospital cost \$444.2 million, and Medi-Cal payment \$292.1 million. Because Medi-Cal was the primary payer, these stays are included within the scope of the DRG payment method. These “No Part A” stays would continue to be priced and paid just like any other Medi-Cal claim.

## 1.9 Out of State Claims

Just 0.4 percent of stays are in out-of-state hospitals, accounting for \$17.3 million in payments (see Table 1.5.1). This percentage is much lower than in most other states, reflecting both the extremely wide range of services available within California, as well as the relative sparseness of the population along the borders with Arizona, Nevada and Oregon. We recommend that out-of-state hospitals be included in the DRG-based payment in the same way as California hospitals. Throughout this project all out-of-state hospitals will be considered as a single group, e.g., when data are presented by Medicare wage area or hospital bed size.

Even in a state the size of California, situations occur in which only an out-of-state hospital can provide a specific type of care. In these situations, we would expect payment to be by DRG, just as it would for any other stay. However, we recommend that the State Plan include authority for the Department to negotiate payment to an out-of-state hospital in extremely rare situations where complex medical services and surgical procedures otherwise would be unavailable. See Section 4.9.

## 1.10 Hospice

Inpatient hospice requires the provider type code “39” (hospice) for billing. Since the DRG project is limited to acute care providers (16 and 60), inpatient hospice will not be affected.

## 1.11 Affected Programs

At a high level, the new hospital inpatient payment method includes claims for services provided to Medicaid eligible beneficiaries enrolled in Medi-Cal fee-for-service programs. In some states, California included, Medicaid rates and fees are used to pay for similar services provided through other state programs.

The new Medi-Cal payment method applies to these two programs.

- **California Children’s Services (CCS).** This program, a partnership between local county health departments and DHCS Children’s Medical Services, provides health care services to children from birth up to 21 years of age with CCS-eligible medical conditions<sup>10</sup>. Most CCS beneficiaries have Medi-Cal eligibility as well and are therefore included in the dataset for this project. Other beneficiaries, who are referred to as “CCS Only,” do not have Medi-Cal eligibility.
- **Genetically Handicapped Persons Program (GHPP).** This program provides health care services for adults (21 years of age or older) with specified genetic diseases. Services may include, but are not limited to hospital, physician, drugs, laboratory, medical supplies, durable medical equipment, and other Medi-Cal covered services per policy, a service authorization form (SAR), is required.<sup>11</sup>

To assist in understanding the impact of the new APR-DRG payment method on these programs, we obtained a separate dataset of CCS-only and GHPP-only claims. Table 1.11.1 shows claims from calendar year 2009, excluding claims from designated public hospitals. For the two programs combined, excluding beneficiaries who also had Medi-Cal eligibility, there were 1,218 claims with \$15.7 million in payments.

Table 1.11.1					
Summary of Affected Programs					
Program	Stays	Charges	Payment	Avg Charges	Avg Payment
CCS	1,073	\$54,263,371	\$12,462,962	\$50,572	\$11,615
GHPP	145	\$15,538,844	\$3,256,292	\$107,164	\$22,457
<b>Total</b>	<b>1,218</b>	<b>\$69,802,215</b>	<b>\$15,719,254</b>	<b>\$57,309</b>	<b>\$12,906</b>
<i>Notes:</i>					
1 Claims from designated public hospitals are excluded.					
2 Claim counts include adjustments, voids and interim claims.					
3 Stays represent CCS-only and GHPP-only claims.					

## 1.12 Medi-Cal Managed Care

Although this project applies to fee-for-service payment, there are two areas of potential impact on Medi-Cal managed care plans.

- ***Out-of-network emergency care.*** In general, managed care beneficiaries nationwide are treated only at hospitals that belong to their plan's provider network. When Medicaid beneficiaries receive emergency care at an out-of-network hospital, federal law says that, in general, the hospital must accept payment from the plan that is no higher than what fee-for-service payment would have been.<sup>12</sup> In California, fee-for-service payment levels have been confidential under the Selective Provider Contracting Program. Therefore the Medicaid program has periodically calculated an average per diem payment amount known as the "Rogers Rate." The plans have used this rate to pay out-of-network hospitals for emergency care. Under DRG payment, payment methods and rates will be public knowledge, so calculation and payment of the Rogers Rate will no longer be needed. Instead, we expect that the plans will pay hospitals based on the fee-for-service DRG payment method. In understanding the details of the payment method, plans and hospitals will be able to turn to the DRG pricing calculator spreadsheet, the "frequently asked questions" document, the state plan amendment, the fee-for-service hospital provider manual, and this Policy Design Document (PDD).
- ***DRG payment as a model.*** Medi-Cal managed care plans are free to set their own payment methods for use with hospitals. Typical options include per diem models, various forms of case rates (including DRGs), percentages of charges, and even different methods for different services within the same contract. The new fee-for-service DRG payment method will give plans another option that they may choose to adopt. Although this may well be appropriate, we caution the managed care plans that the DRG method has been designed only with the fee-for-service population in mind. Extension of its use to the managed care population would require a separate analysis of appropriateness. With that caveat, however, we note that the DRG method has been designed to cover all medical conditions and to be flexible enough to accommodate a wide range of payment policy options.

In developing the recommendations in this document, we have also taken into account the significant transition to managed care now taking place in the Medi-Cal program. Although we used 2009 claims data as the basis for our analysis, we also simulated the impact of the managed care transition as if it had already occurred by 2009. See Section 1.13, of the *Summary of the Analytical Dataset*, December 2011.

# 1.13 Analytical Dataset and Simulation Dataset

For purposes of developing the DRG payment method, we created two datasets based on paid Medi-Cal claims for inpatient care in CY 2009.

- **Analytical dataset.** The analytical dataset is intended to reflect all complete stays for Medi-Cal fee-for-service inpatient claims in CY 2009. The most notable exclusions were stays at designated public hospitals and claims for incomplete stays. Designated public hospitals are outside the scope of DRG payment. Claims for incomplete stays (i.e., where a claim was received for only part of a patient's stay) were excluded because payment for DRG will be for a complete stay. The 2009 payments for incomplete stays, however, will be factored into the budget projections for 2013.
- **Simulation baseline dataset.** Medi-Cal is currently in the middle of a major transition of fee-for-service beneficiaries to managed care. The DRG payment method being implemented in 2013, therefore will be applied to a population that is smaller than, and different from, the analytical dataset. We therefore modeled the impact of the managed care transition as if it had been completed by January 1, 2009. Throughout this policy design document, when we refer to claims data we usually refer to the simulation baseline dataset.

Table 1.13.1 shows that the analytical dataset comprises 538,470 stays with \$3.5 billion in payments in CY 2009. After exclusion of stays that were modeled as moving to managed care, the simulation dataset comprises 446,715 stays with \$2.6 billion in payment. Documentation of the many steps taken to create the analytical dataset and the simulation baseline dataset is contained in a separate report to DHCS, *Medi-Cal DRG Project: Summary of the Analytical Dataset*, December 2011. The report also includes numerous tables showing various views of the two datasets.

All use of the CY 2009 datasets is subject to strict oversight by DHCS, because the datasets contain protected health information about Medi-Cal beneficiaries as well as on hospital-specific payment levels that are confidential under the Selective Provider Contracting Program

Table 1.13.1

## Overview of Analytical Dataset and Simulation Dataset

Description	Stays	Days	Charges	Est. Cost	Baseline Payment	Casemix	Cost / Chg	Pay / Cost	ALOS	Avg Chg	Avg Cost	Avg Pay
<b>Received dataset</b>	<b>659,616</b>	<b>2,826,260</b>	<b>\$25,664,273,324</b>	<b>\$5,980,149,959</b>	<b>\$4,444,652,164</b>	<b>0.72</b>	<b>23%</b>	<b>74%</b>	<b>4</b>	<b>\$38,908</b>	<b>\$9,066</b>	<b>\$6,738</b>

<i>Notes:</i>												
1 Data are the responsibility of Xerox and should not be attributed to any California state agency.												
2 Payment figures exclude supplemental payments. Casemix is measured using national relative weights for APR-DRG V.29.												
3 The received dataset excluded \$384 million of payment for claims with a first date of service in 2009 but no discharge date in 2009 or 2010. We call these situations incomplete stays because the claim did not represent a complete stay. See <i>Summary of Analytical Dataset</i> Section 2.1.2. Under the new method, these claims would be paid entire as complete stays or with the partial eligibility adjustment.												
4 The simulation of the managed care transition shown here was done for purposes of the DRG project and may differ from separate simulations done by DHCS for other purposes. See <i>Summary of Analytical Dataset</i> , Section 2.12, regarding the purpose and method for the managed care transition data.												

# 2 Casemix Measurement and Relative Weights

## 2.1 Overview of DRG Payment Calculations

### Box 2.1.1 Payment Method Features that Enable Policy Flexibility

- APR-DRG grouper covers all inpatient conditions
- Policy adjustors allow explicit customization of relative weights
- Age adjustor allows adjustment to payment based on patient age
- DRG base price may be statewide or hospital-specific
- Add-on payment field enables hospital-specific payments that are separate from DRG payment

DRG payment methods, like other prospective payment systems, can be summed up by the mnemonic “groups, weights, rates, and rules.”

- **Groups.** The group, or DRG, is the unit of payment assigned, so that each group contains stays that are similar both clinically and in terms of typical hospital resource use.
- **Weights.** Each group has a relative weight, set to reflect how different DRGs relate to each other in terms of typical hospital resource use.
- **Rates.** Relative weights are converted into rates by applying a dollar-denominated DRG base price, which can be the same for all hospitals or can vary by hospital.
- **Rules.** Lastly, the payment method includes “rules,” such as how payment is adjusted when a patient is transferred between hospitals.

Section 2.2 is the principal section on “groups,” followed by Section 2.5 on “weights,” Section 3.1 on “rates” and much of Section 4 on “rules” for specific situations. In this Section 2.1, we provide an overview of the formulas that are typically used in calculating payment. The structure of the payment method has to be flexible enough to accommodate policy changes over the next 10 years to 20 years.

Chart 2.1.1 shows six stays at two hospitals. The examples are generic and not specific to any particular DRG grouping algorithm. In general, the relative weight is calculated from an outside dataset; the values are not a policy choice. A payer can then choose to apply “policy adjustors” or “age adjustors” to increase or decrease the relative weight. Age adjustors are applied to specific DRGs based on the care category. In the example, a policy adjustor of 1.50 is applied to newborn DRGs, making payment 50% higher than it otherwise would have been. Similarly, an age adjustor of 1.25 is applied to asthma DRGs, making payment 25 percent higher for patients below a specific age.

The relative weight used for payment is the product of the casemix relative weight, the policy adjustor and the age adjustor.

The payment relative weight is then multiplied by the DRG base price to calculate the DRG base payment. In all examples, Hospital 1 has a DRG base price of \$4,000 and Hospital 2 has a DRG base price of \$5,000.

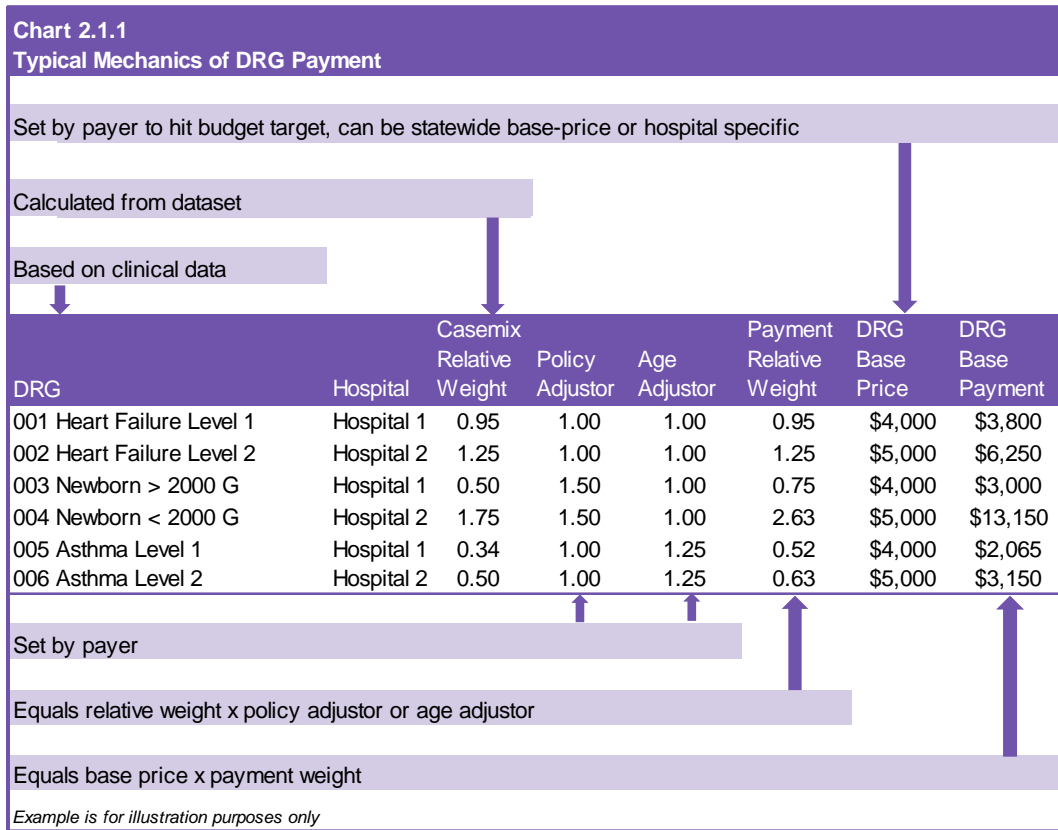

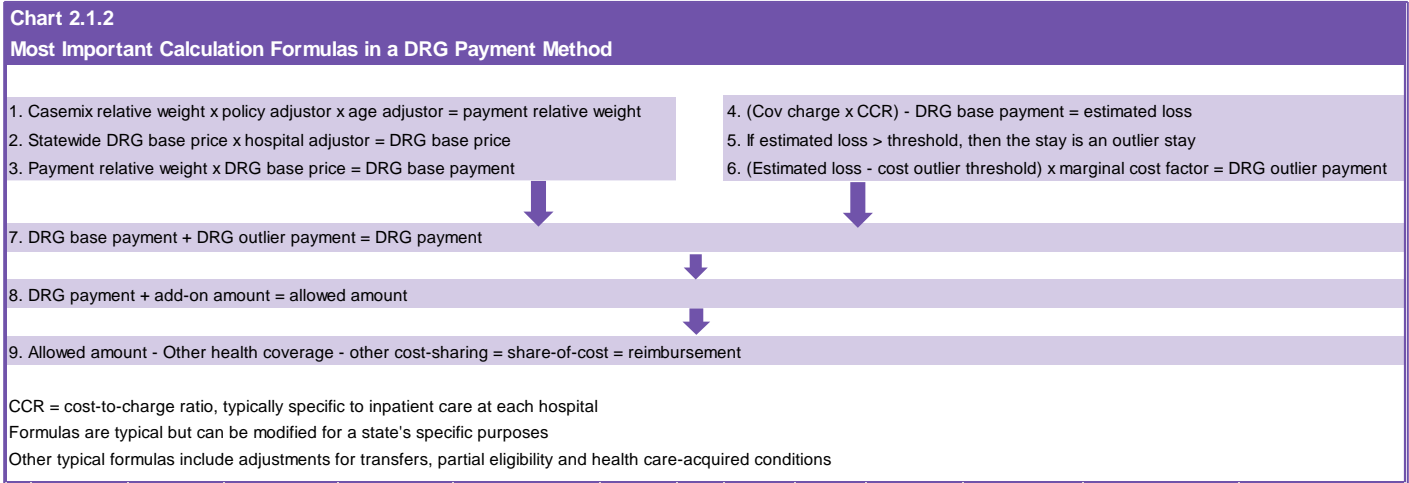

Chart 2.1.2 puts the calculation of the DRG base payment into broader context. The DRG base payment is calculated in the top left-hand box, while a DRG cost outlier payment is calculated in the top right-hand box.

The DRG base payment plus the DRG outlier payment equals the DRG payment. (Note the distinction between “DRG base payment” and “DRG payment.”) The DRG payment plus unrelated “add-on” payments equal the allowed amount (sometimes confusingly referred to as the allowed charge). This represents the amount “allowed” by a payer as payment for the service provided. If the patient or a third party is liable for some part of payment, then the patient’s other health coverage or share of cost amounts are subtracted from the allowed amount to yield the actual Medicaid reimbursement.

As a general rule – not necessarily true in Medi-Cal – Medicaid reimbursement for hospital inpatient services usually averages about 97 percent of the allowed amount. Throughout this document, when we refer to “payment” we are referring to the allowed amount since that is the payment rate set by a payer. See Section 4.5 regarding the difference between the allowed amount and the reimbursement.

## 2.2 Casemix Measurement

The heart of a DRG payment method is the DRG grouping algorithm itself. DRGs define the “product of a hospital,” so an appropriate DRG grouper must do a good job categorizing the incredible range of inpatient activities into a tractable number of groups, each of which includes patients similar both clinically and in terms of hospital resources required for their care. To take an extreme example, categorizing all newborns into a single DRG would obviously be inappropriate both clinically and in terms of hospital resources. When DRGs are used for payment, inaccuracies in the DRG algorithm may not have immediate impacts, but they can have major impacts over time. For newborns, the impact would be to make neonatal intensive care units financially disastrous for hospitals, with subsequent impacts on access to care. As this example suggests, it also matters what share of the market a DRG payer has. For Medi-Cal, the DRG grouper must be particularly accurate for newborns, pediatrics and obstetrics. If, for the sake of argument, it is less accurate for cardiac catheterization, then the implications are less serious because the financial viability of catheterization labs depends on Medicare rates. For the Medicare DRG grouper, on the other hand, accuracy in measuring obstetric and pediatric care is immaterial and accuracy in measuring adult conditions is paramount. A central reason why Medicare moved to a new grouper algorithm in 2007, for example, was to improve accuracy in measuring complex adult conditions.

As shown in Table 2.2.1, there are eight distinct DRG algorithms available. We recommend the use of All Patient Refined Diagnosis Related Groups (APR-DRGs), for three reasons.

1. Applicability of APR-DRGs to Medicaid
2. Adoption of APR-DRGs by Medicaid and other payers
3. Applicability to paying for quality

Table 2.2.1

Comparison of DRG Algorithms

Algorithm	Developer	All-Patient Structure	All-Patient Weights	Marketed for Medicaid	Medicaid Payer Use	Other Payer Use	Use for Analysis	Use to Measure Quality
CMS-DRGs	3M for CMS	No	No	No	Yes	Yes	Yes	No
MS-DRGs	3M for CMS	No	No	No	Yes	Yes	Yes	Yes
AP-DRGs	3M	Yes	Yes	Yes	Yes	No	No	No
APR-DRGs	3M/NACHRI	Yes	Yes	Yes	Yes	Yes	Yes	Yes
APS-DRGs	OptumInsight	Yes	Yes	Yes	No	No	Yes	No
Tricare DRGs	3M for Tricare	Yes	No	No	Yes	Yes	No	No
R-DRGs	HSC	Yes	Yes	Yes	No	No	Yes	No
Thom-DRGs	Thomson	Yes	Yes	No	No	No	Yes	No

Note: Xerox has no financial interest in any DRG grouping algorithm.

## 2.2.1 Applicability of APR-DRGs to Medicaid

The obvious path for a Medicaid DRG payment method would be to follow Medicare, and in fact many states that adopted DRGs in the 1980s did adopt Medicare DRGs. Mindful of this influence, Medicare split some DRGs into pediatric and adult DRGs and announced plans to improve the structure of its neonatal DRGs despite the fact that Medicare pays for, literally, fewer than 20 newborns a year.<sup>13</sup> In developing relative weights by DRG, it also supplemented its own data with all-patient claims data from approximately 20 states in order to calculate more stable weights for neonatal, pediatric and obstetric DRGs.

In a significant policy shift, the Centers for Medicare and Medicaid Services (CMS) announced in 2004 that it would no longer take the needs of other payers into account.

“We advise those non-Medicare systems that need a more up-to-date system to choose from other systems that are currently in use in this country, or to develop their own modifications. As previously stated, we do not have the data or the expertise to develop more extensive newborn and pediatric DRGs. Our mission in maintaining the Medicare DRGs is to serve the Medicare population.”<sup>14</sup>  
(Emphasis added)

Moreover, in 2007 Medicare itself adopted a new grouper, which was the most significant change in the Medicare inpatient payment method since 1983. The new grouper, called Medicare Severity DRGs or MS-DRGs, is a completely new algorithm that, among other changes, increased the number of DRGs from 538 to 745. In describing MS-DRGs, CMS made several statements intended to underscore that MS-DRGs were developed only for the Medicare population. For example:

“The MS-DRGs were specifically designed for purposes of Medicare hospital inpatient services payment. As we stated above, we generally use MEDPAR data to evaluate possible DRG classification changes and recalibrate the DRG weights. The MEDPAR data only represent hospital inpatient utilization by Medicare beneficiaries. We do not have comprehensive data from non-Medicare payers to use for this purpose. The Medicare program only provides health insurance benefits for people over the age of 65 or who are disabled or suffering from end-stage renal disease. Therefore, newborns, maternity, and pediatric patients are not well represented in the MEDPAR data that we used in the design of the MS-DRGs. We simply do not have enough data to establish stable and reliable DRGs and relative weights to address the needs of non-Medicare payers for pediatric, newborn, and maternity patients. For this reason, we encourage those who want to use MS-DRGs for patient populations other than Medicare make the relevant refinements to our system so it better serves the needs of those patients.”<sup>15</sup>

For Medicaid programs, some of the key problems with MS-DRGs are:

- **Medicare focus.** All analysis was done only on a Medicare dataset that reflects the Medicare population of people age 65 and over or people under 65 with disabilities. Relative to a Medicaid population, including the Medi-Cal population, the newborn, pediatric and obstetric populations are grossly under-represented. MS-DRGs take little account of specific conditions that are more often seen in the younger Medicaid population, such as sickle cell anemia, cystic fibrosis, repair of congenital defects, respiratory syncytial virus (RSV), pneumonia, bronchiolitis and other pediatric infections.

- **Discontinuation of pediatric DRGs.** Under CMS-DRGs, Medicare had 41 DRGs that were specific to patients under age 18 (in addition to the neonate DRGs). Medicare made these splits because of statistically significant differences in hospital resources by age. These splits have been discontinued and MS-DRGs reflect no consideration of the impact of pediatric age on hospital resource use by DRG.
- **No consideration of children with complex medical needs.** Even with the age splits of CMS-DRGs, the algorithm was less than adequate in grouping children with complex medical needs, e.g., cardiovascular anomalies, spina bifida, cerebral palsy, and cancer.<sup>16</sup> For these patients, MS-DRGs are completely inadequate.
- **No updates to obstetric and newborn DRGs.** The structure of the obstetric and newborn DRGs was unchanged from the previous CMS-DRG algorithm, that is, essentially unchanged since the 1980s.
- **No use of birthweight.** Birthweight has been shown to be a very strong predictor of length of stay and hospital cost, yet MS-DRGs do not use birthweight in grouping. A study in the journal *Pediatrics* confirmed earlier studies that the Medicare grouper systematically over-pays for normal newborns and under-pays for sick babies.<sup>17</sup>
- **Inappropriate CC list for obstetrics.** Like CMS-DRGs, MS-DRGs use a standard list of complications and comorbidities (CC) to adjust the severity of an individual patient's DRG assignment. For MS-DRGs, Medicare updated the list and split it into CCs and major CCs. It did not, however, adjust the list for the different implications that individual CCs may have on obstetric cases. Hypertension and diabetes, for example, are typically more clinically significant in obstetric patients than in medical and surgical patients.

For Medicaid programs that follow Medicare's lead in inpatient payment, the introduction of MS-DRGs created an uncomfortable situation. Either they continue to use CMS-DRGs, which are no longer maintained by CMS or anyone else, or they adopt MS-DRGs, which CMS says are unsuitable for non-Medicare populations. Many states are considering their options. As shown in Chart 2.2.1.1, APR-DRGs have been selected for implementation by Medicaid programs in Colorado, Illinois, New York, Maryland, Massachusetts, Mississippi, Montana, North Dakota, Pennsylvania, Rhode Island, South Carolina and Texas.

<b>Guide:</b>	CMS-DRGs:	Centers for Medicare and Medicaid Services Diagnosis Related Groups (used by Medicare until 10/1/07)
	MS-DRGs:	Medicare Severity DRGs (used by Medicare starting 10/1/07)
	AP-DRGs:	All Patient DRGs (3M)
	APR-DRGs:	All Patient Refined DRGs (3M)
	Tricare-DRGs:	DRGs used by Tricare (formerly Civilian Health and Medical Program for Uniformed Services)

*Notes:*

- 1 Sources: Individual states, Xerox State Healthcare, 3M Health Information Systems, Ingenix Inc., Navigant Inc.
- 2 Xerox does not have a financial interest in any DRG grouping algorithm.
- 3 Payment method refers to the primary method of payment for general acute care hospitals.

To analyze the suitability of MS-DRGs and APR-DRGs for the Medi-Cal population, the California Hospital Association asked the Triage Consulting Group to apply both algorithms to the 2008 Medi-Cal patient discharge dataset compiled by the Office of Statewide Health Planning and Development. Standard practice is to examine the reduction in variance ( $R^2$ ) in hospital resource use that results from grouping stays by DRG.<sup>18</sup> As Chart 2.2.1.2 shows, APR-DRGs explained 49 percent of the variation in the cost of care, performing better overall than MS-DRGs (39 percent).

Moreover, APR-DRGs performed better in 10 of the 11 Medicaid Care Categories, with the differences in the obstetric, neonate, pediatric respiratory and pediatric miscellaneous categories particularly notable for a Medicaid population. The exception was the normal newborn category, where the two algorithms performed very similarly. These results echo similar results obtained from analyses of Medicaid data in Mississippi, Rhode Island and Montana.<sup>19</sup>

## 2.2.2 Adoption of APR-DRGs

The choice of a particular DRG algorithm will affect the payment of billions of dollars to California hospitals in coming years, affecting not only hospital finances, but also access to care for Medi-Cal beneficiaries, especially in areas where the program has a sizable share among payers. Therefore, the chosen grouper should be very well scrutinized and understood. APR-DRGs meet this standard.

In addition to adoption of payment by Medicaid programs as described above, APR-DRGs also have been adopted or planned for use by Wellmark plans in Iowa and South Dakota and by BlueCross BlueShield plans in Massachusetts, Minnesota, Nebraska, New York and Tennessee. APR-DRGs are also widely used to adjust for casemix differences in measuring hospital performance with regard to mortality, potentially preventable readmissions and potentially preventable complications. Examples include *U.S. News & World Report*, HealthGrades.com, the Joint Commission, and analysis of Medicare data by the Medicare Payment Advisory Commission (MedPAC).

At the state level, APR-DRGs have been used to adjust for casemix differences in performance measures in Florida, Hawaii, Maryland, Massachusetts, New York, Texas, and Utah. 3M Health Information Systems, which owns APR-DRGs, reports that over 2,000 hospitals nationwide hold APR-DRG licenses and that APR-DRGs have been used or evaluated in over 50 journal articles.

The most common criticisms of APR-DRGs are their complexity and the fact that they are dissimilar to Medicare MS-DRGs. In both cases, there are offsetting benefits. The structure is complex because APR-DRGs are a sophisticated algorithm especially designed to capture the costs of patients with multiple comorbidities. Although the 18-step grouping logic is complex, all steps are detailed in a publicly available definitions manual. It is possible to walk a claim through the algorithm to derive the APR-DRG assignment. The structure of DRGs – 314 base DRGs, each with four levels of severity – is dissimilar to MS-DRGs, but the APR-DRG structure has the advantage of being easier to understand. Medicare, on the other hand, sometimes separates a condition into three severities (no complications or comorbidities, with CC, with major CC) and combines two or all severity levels into a single DRG. As noted above, the APR-DRG structure was also designed for use with an all-patient population while MS-DRGs were not.

## 2.2.3 Applicability to Paying for Quality

At the national level, there has been considerable interest in measuring and incentivizing provision of quality care, especially with regard to reducing potentially preventable readmissions and the complications of inpatient care. Similarly, there has been much discussion of possibly bundling episodes of inpatient and related outpatient care. While discussion of these topics is beyond the scope of this project, we do believe that such initiatives must include accurate risk adjustment. For example, simple counts of readmissions are unfair to hospitals that have significant numbers of readmissions that are not potentially clinically related to the original admission.

At this time, APR-DRGs have been used more widely than any other DRG algorithm to risk-adjust measurements of quality and therefore are more likely than other algorithms to be suitable in the future. As noted above, they are certainly more applicable for risk adjustment in a Medicaid population than MS-DRGs.

## 2.3 DRG Grouper Version

Although there are various DRG algorithms, some even with different developers, a convention of the industry is that all versions are numbered in parallel starting from October 1, 1983. For example, the first version of MS-DRGs and APR-DRGs was V.25, effective October 1, 2007. New versions are issued October 1 of each year, to coincide with the release of the new ICD-9-CM diagnosis and procedure codes, upon which the DRG logic relies.

Payment simulations for this project are being done using V.29 of APR-DRGs, which was released October 1, 2011. This version includes logic to identify health care-acquired conditions (Section 4.10.1).

For implementation January 1, 2013, we recommend that Medi-Cal implement the same APR-DRG version as has been used for data analysis and in development of the policy design document, that is, V.29. This time frame will allow time for the Department and the hospitals to install and test the APR-DRG grouper version 29.

We recommend that V.30, which will be released October 1, 2012, not be used for the January 2013 implementation. The reason is that substantial changes, including a change in the total number of APR-DRGs, are expected to occur between V.29 and V.30. For both the Department and the hospitals, it would be too rushed to attempt to analyze, simulate and implement V.30 in the three months between October 1 and January 1. Instead, we recommend that V.31 be implemented July 1, 2014. The 18-month interval between versions will allow time for analysis of (probably) nine months of claims paid under the DRG method.

Although there are typically changes in ICD-9-CM codes each October, no changes are expected on October 1, 2012. The reason is that the ICD-9-CM coding scheme will be frozen in anticipation of ICD-10 implementation. Therefore code mapper software will not be needed; this software is typically used when a payer continues to use a previous year's DRG version.

## 2.4 ICD-10 Impact

### 2.4.1 Background

The compliance date for implementation of the International Classification of Diseases, 10th Edition, Clinical Modification/ Procedure Coding System (ICD-10-CM/PCS) was originally set for October 1, 2013, for all covered entities. In the April 17 *Federal Register*, CMS proposed a new date of October 1, 2014, which we have used in this discussion.

ICD-10-CM/PCS will enhance accurate payment for services rendered and facilitate evaluation of medical processes and outcomes. The United Kingdom, Australia and Canada have already moved to ICD-10. The new classification system provides significant improvements through more detailed information and the ability to expand in order to capture additional advancements in clinical medicine. ICD-10-CM and ICD-10-PCS are the American variants of the ICD-10 system.

- **ICD-10-CM.** The diagnosis classification system was developed by the Centers for Disease Control and Prevention for use in all health care treatment settings. Diagnosis coding under this system uses three to seven alpha and numeric digits and full code titles, while the ICD-9-CM coding system uses three to five alpha or numeric digits.
- **ICD-10-PCS.** The procedure classification system was developed by the Centers for Medicare and Medicaid Services (CMS) for use only in inpatient hospital settings. The new procedure coding system uses seven alpha or numeric digits while the ICD-9-CM coding system uses three or four numeric digits.

ICD-10-CM/PCS includes much greater specificity and clinical information and provides updated medical terminology and classification of diseases. Table 2.4.1.1 shows two examples where ICD-10-CM/PCS codes are more precise and provide better information.<sup>20</sup>

Table 2.4.1.1 Comparative Examples for ICD-9-CM and ICD-10-CM	
ICD-9-CM	ICD-10-CM
<b>Example: Pressure Ulcer Codes</b>	
9 location codes (707.00 – 707.09) <ul style="list-style-type: none"> <li>• Show broad location, but not depth (stage)</li> </ul>	125 codes <ul style="list-style-type: none"> <li>• Show more specific location as well as depth, including:               <ul style="list-style-type: none"> <li>○ L89.131 – Pressure ulcer of right lower back, stage I</li> <li>○ L89.132 – Pressure ulcer of right lower back, stage II</li> <li>○ L89.133 – Pressure ulcer of right lower back, stage III</li> <li>○ L89.134 – Pressure ulcer of right lower back, stage IV</li> <li>○ L89.139 – Pressure ulcer of right lower back, unspecified stage</li> <li>○ L89.141 – Pressure ulcer of left lower back, stage I</li> <li>○ L89.142 – Pressure ulcer of left lower back, stage II</li> <li>○ L89.143 – Pressure ulcer of left lower back, stage III</li> <li>○ L89.144 – Pressure ulcer of left lower back, stage IV</li> <li>○ L89.149 – Pressure ulcer of left lower back, unspecified stage</li> <li>○ L89.151 – Pressure ulcer of sacral region, stage I</li> <li>○ L89.152 – Pressure ulcer of sacral region, stage II</li> </ul> </li> </ul>
<b>Example: Angioplasty</b>	
<ul style="list-style-type: none"> <li>• 1 code (39.50)</li> </ul>	854 codes <ul style="list-style-type: none"> <li>• Specifying body part, approach, and device, including:               <ul style="list-style-type: none"> <li>○ 047K04Z – Dilation of right femoral artery with drug-eluting intraluminal device, open approach</li> <li>○ 047K0DZ – Dilation of right femoral artery with intraluminal device, open approach</li> <li>○ 047K0ZZ – Dilation of right femoral artery, open approach</li> <li>○ 047K34Z – Dilation of right fem. art. with drug-eluting intraluminal device, percutaneous approach</li> <li>○ 047K3DZ – Dilation of right fem. art. with intraluminal device, percutaneous approach</li> </ul> </li> </ul>

## 2.4.2 Timing for CA-MMIS Changes

Medicaid programs and other payers across the country have two broad options for implementing ICD-10 in their claims processing systems. The first is to do a complete remediation, changing all adjudication logic and data tables to make full use of the rich detail available under ICD-10. The second is an interim solution, under which ICD-10 codes are mapped to ICD-9 codes at the front end of the claims processing system and then the ICD-9 codes continue to be used within the system, including in the assignment of DRGs. Because California is replacing its legacy claims processing system with a completely new system, DHCS has chosen to implement the ICD-10 / ICD-9 crosswalk as an interim solution. This decision applies to the MMIS in general, not just to inpatient claims payment.

Chart 2.4.2.1 Sequencing of APR-DRG Version Changes with ICD-10 Implementation			
Date	APR-DRG Release	Medi-Cal Implementation	In MMIS
10/1/2011	V.29 (Minor changes)		
1/1/2012			
4/1/2012			
7/1/2012			
10/1/2012	V.30 (Major changes)		
1/1/2013		V.29 (implementation)	V.29 ICD-9
4/1/2013			V.29 ICD-9
7/1/2013			V.29 ICD-9
10/1/2013	V.31 (Minor changes)		V.29 ICD-9
1/1/2014			V.29 ICD-9
4/1/2014			V.29 ICD-9
7/1/2014		V.31 (ICD-9 version)	V.31 ICD-9
10/1/2014	V.32 (Minor changes)	Updated ICD-10 to ICD-9 mapper	V.31 ICD-9
1/1/2015			V.31 ICD-9
4/1/2015			V.31 ICD-9
7/1/2015			V.31 ICD-9
10/1/2015	V.33 (Minor changes)	Updated ICD-10 to ICD-9 mapper	V.31 ICD-9
1/1/2016			V.31 ICD-9
4/1/2016		CA-MMIS Health Enterprise & V.33	V.33 ICD-10
7/1/2016			V.33 ICD-10
10/1/2016	V.34		V.33 ICD-10
1/1/2017			V.33 ICD-10
4/1/2017			V.33 ICD-10
7/1/2017		V.34	V.34 ICD-10
10/1/2017	V.35		V.35 ICD-10
Notes:			
1. ICD diagnosis and procedure codes are updated nationwide each October 1. ICD-10 is proposed for implementation October 1, 2014.			
2. This chart assumes that Medi-Cal would make annual grouper updates each July 1, starting July 1, 2017.			
3. 3M releases a new version of the APR-DRG algorithm each October 1.			

According to 3M staff, the last ICD-9 version of the APR-DRG software will be V.31, with an effective date of October 1, 2013 (Chart 2.4.2.1). We therefore recommend that DHCS move directly from V.29 to V.31, with a target date of July 1, 2014. This means that V.29 would be in place for the 18 months between January 1, 2013 and July 1, 2014. Even with the time lags in claims submission and adjudication, the Department would therefore have a solid dataset of paid claims history to use in modeling the impact of changing from V.29 to V.31. This is important, because V.31 will continue the major changes in APR-DRG logic being made between V.29 and V.30. Only minor changes, if any, are expected between V.30 and V.31.

The new CA-MMIS will include complete ICD-10 functionality, at which time DHCS would update APR-DRG version to the most current algorithm (expected to be V.33). This plan is expected to be feasible because only minor changes in the APR-DRG logic are expected within the first several years of ICD-10. For V.29, 3M will make available both an ICD-9 version and an ICD-10 version, which may aid in modeling the transition from V.31 (ICD-9) to V.33 (ICD-10).

Once the new CA-MMIS is implemented, we recommend the Department consider an annual process with the start of each state fiscal year, that is, July 1. With new grouper versions expected each October 1, a nine-month interval would allow time for the Department to analyze the impacts of the new version and for it to be installed and tested in CA-MMIS. Similarly, the nine-month interval would facilitate planning by the hospitals.

## 2.5 Relative Weights

The choices of a grouping algorithm and the choice of a basis for relative weights are logically separate. Once a Medicaid program has chosen the grouping algorithm, the relative weights can be adopted from another payer, calculated from a national dataset like the Nationwide Inpatient Sample, or calculated by a state from its own data.

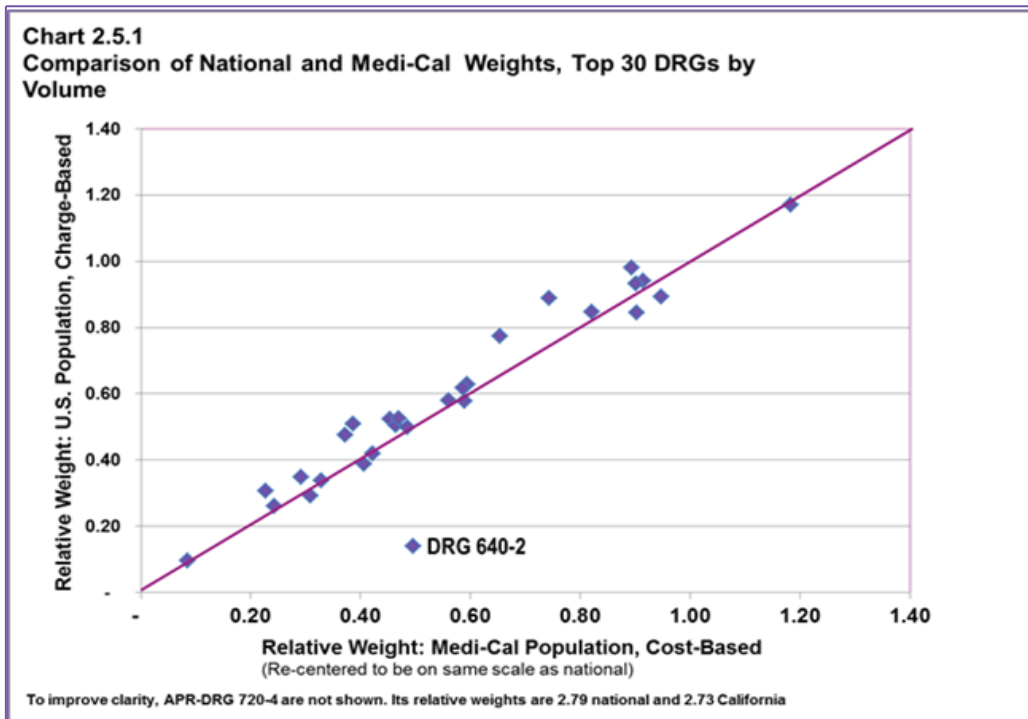

For every payer, there are two challenges in calculating DRG weights. The first is the substantial effort necessary to regularly update and recalibrate the set of DRG weights. The second issue – even in California – is that some DRGs do not occur often enough to yield stable weights. In our analytic dataset of 2009 Medi-Cal claims, for example, there are 381 out of 1,256 APR-DRGs that have fewer than 30 stays and another 29 APR-DRGs with zero stays.<sup>21</sup> In the simulation baseline dataset (i.e., after considering the expected transition of many beneficiaries to managed care), there are 458 APR-DRGs with fewer than 30 stays and 43 APR-DRGs with zero volume. There are ways to deal with the issue of unstable weights, but one simple solution is to use relative weights calculated by someone else from national data. The essential caveat, of course, is that the national weights would have to be accurate for the California dataset.

To analyze this question, we calculated both cost-based and charge-based weights from the analytical dataset. Although weight calculation can be an esoteric topic,<sup>22</sup> in essence it is very simple.

If the average cost of a stay in DRG 123 is \$15,000 and the overall average cost per stay is \$10,000, then the relative weight of DRG 123 is 1.50. Refinements can be made by trimming extreme stays from the dataset, but such refinements would not affect the results discussed here.

Table 2.5.1 shows alternative sets of relative weights as well as other statistics commonly used in evaluating claims datasets for purposes of weight calculation. We first calculated Medi-Cal charge-based and Medi-Cal cost-based weights. As expected, the results were virtually identical (correlation coefficient = 0.999 for the 30 most common DRGs and 0.985 for all DRGs). Although the levels of charges and costs for any one DRG are very different, the positions of DRGs relative to each other tend to be very similar regardless of whether one uses charges or cost as the measure. We therefore chose to compare cost-based relative weights with national charge-based APR-DRG weights. The V.29 national weights are calculated by 3M Health Information Systems from a two-year dataset of 15.5 million stays in the Nationwide Inpatient Sample, which includes general hospitals and freestanding children’s hospitals. To make the comparison easier to visualize, we re-centered the Medi-Cal weights, so that the overall average would be 0.70, that is, the same overall average that stems from application of national weights to the Medi-Cal data. (We used the analytical dataset, rather than the simulation baseline dataset, in order to make use of as much data as possible.)

As shown in Chart 2.5.1, there is a very high degree of correlation ( $r=0.984$ ) between the two sets of weights for the 30 most common DRGs, which account for 63 percent of all stays.<sup>23</sup> The notable exception – APR-DRG 640-2 for a normal newborn, severity 2 – stems from anomalous stays in the analytical dataset.<sup>24</sup> For this APR-DRG, the national weight would in fact be more appropriate than the Medi-Cal calculated weight. This degree of correlation extends to other, less common DRGs, as shown in Table 2.5.1 ( $r=0.851$  for all DRGs). This finding echoes our findings from Medicaid data in other states. In fact, it’s stronger than in other states we have examined, probably because California’s size gives it disproportionate weight among the 44 states upon which the Nationwide Inpatient Sample is based. In Mississippi, Montana, North Dakota, Rhode Island and South Carolina, Medicaid chose to use national weights and save itself the effort of recalibrating weights every year. New York Medicaid, on the other hand, is an example of a state that chose to calculate its own APR-DRG relative weights. Pennsylvania adopted New York weights.

Because the national weights do fit the Medi-Cal data well, we recommend that the Department simply adopt the updated relative weights whenever a new grouper version is installed.

Throughout the rest of this report, the terms “relative weight” and “casemix” may be used interchangeably. For convenience, we usually use “relative weight” when referring to payment calculation and “casemix” when referring to average patient severity. For example, we say that the one DRG has a higher relative weight than another DRG, but that one hospital has a higher casemix than another hospital.

## 2.6 Policy Adjustor Functionality

### Box 2.6.1 Remaining Decision before Implementation

- Make policy decision about whether to use policy adjustors and, if so, for which care categories, and at what values.

While the relative weights are calculated purely from the data, policy adjustors can be used to explicitly increase or decrease payment weights for certain care categories or for a range of DRGs in order to meet policy goals. The rationale is essentially that the Medicaid program may choose to focus its scarce funds in the clinical areas where Medicaid funding makes the most difference to beneficiary access.<sup>25</sup> By making the policy adjustor explicit, the internal consistency of the set of relative weights is maintained. The calculation formula (including the age adjustor to be discussed in Section 2.7) is:

$$(2.6.1) \text{ CASEMIX RELATIVE WEIGHT} \times \text{POLICY ADJUSTOR} \times \text{AGE ADJUSTOR} = \text{PAYMENT RELATIVE WEIGHT}$$

Because this payment method may be in place for many years (Section 1.2), we recommend that policy adjustor functionality be included in the MMIS design even if policy adjustors are not immediately used (i.e., the values are all set at 1.00). We also recommend that separate MMIS fields be created for the casemix relative weight and the payment relative weight, for purposes of documentation.

If the Department decides to use policy adjustors in the future, we recommend that policy adjustors be few in number, apply to entire Medicaid Care Categories, and be initiated for compelling policy reasons, e.g., to enable access for care where Medicaid payment levels can have substantial impact. We recommend against tinkering with relative weights for individual APR-DRGs.

The value of the policy adjustor is typically calculated on a spreadsheet as part of a payment method simulation based on one year's worth of data. Policy adjustors are generally intended to be budget neutral; that is, if a policy adjustor increases payment for a certain category of cases then the DRG base price should be adjusted, so that the overall impact is budget neutral.

## 2.7 Age Adjustor Functionality

### **Box 2.7.1 Remaining Decision before Implementation**

Make policy decision about whether to use age adjustor, and, if so, for which care categories, at what value, and below which age threshold.

An age adjustor is parallel in structure and purpose to a policy adjustor, except that application of the policy adjustor depends on the specific DRG while application of the age adjustor depends on the age of the patient. In the interest of maintaining policy flexibility for coming years, we recommend that the CA-MMIS DRG table include an “age adjustor” field. This structure would enable the age adjustor to have different values by DRG, although we do not recommend that level of specificity.

We note that the APR-DRG structure already takes some account of the age of the patient, either through the base APR-DRG (e.g., creation of a separate DRG for bronchiolitis and RSV pneumonia, which are prevalent in young children) or through the severity of illness assignment. A Medicaid program’s use of an age adjustor, therefore, represents an explicit decision to direct funding to a particular group of patients who are otherwise similar clinically.

As with the policy adjustor, we recommend that use of the age adjustor be limited to a few broad and important situations. For example, the Rhode Island Medicaid program uses an age adjustor to boost payment for pediatric patients whose stays group to a mental health APR-DRG. A single policy adjustor value applies to all mental health DRGs. In the interest of both policy and MMIS simplicity, we also recommend that there be a single definition of age as defined in the MMIS by a parameter (e.g., age under 18, 19, 20, or 21). Initially, the age adjustor will be set to apply to patients under 21.

Like policy adjustors, an age adjustor is generally intended to be budget neutral.

## 2.8 Updating Relative Weights and Policy Adjustors

We recommend that relative weights be updated whenever the DRG grouper is updated. This is essentially a technical exercise since relative weights are calculated from data and are not a policy choice. Although relative weights are calibrated at the national level to average out to 1.00, it is important for a Medicaid program to confirm the expected impact on its own data. This is typically done by taking a list such as Table 2.5.1, calculating the overall average relative weight, using the previous set of weights, and then recalculating the overall average relative weight using the new set of weights. A technical, offsetting correction can be made to either the relative weights or the DRG base price so that the net impact is budget neutral. For example, consider the situation where the DRG base price was \$6,000 and the average casemix of a one-year dataset under the old DRG version is 0.65. If casemix for the same dataset were, say, 0.67 under the new DRG version, then payments would rise by 3 percent simply because of the change in DRG version. To offset this impact, either the base price could be lowered by 3% or each relative weight could be lowered by 3 percent. In any case, the goal is that any change in overall payments stem from an explicit policy choice, not from an update of relative weights. The chief challenge in performing such an update tends to be communication: the decrease in the DRG base price or the relative weights may be interpreted as a payment reduction, when in fact it is simply technical correction to maintain budget neutrality. The same considerations, of course, would justify an increase in the DRG base price or the set of relative weights if a DRG version change were to result in decreased total payment.

If the APR-DRG grouper version has few changes (Section 2.3), then it is probably unnecessary to re-group the claims. If there have been substantial changes in the DRG structure, then it may be necessary to perform a claim-level analysis. The annual APR-DRG documentation from 3M describes the extent of the changes made each year.

If policy adjustors or age adjustors are used, we recommend that they be reviewed annually to determine whether they remain appropriate. See also Section 6.5 regarding policy update and file maintenance tasks.

On a related note, the growing use of APR-DRG payment methods by states will tempt analysts into simply comparing DRG base prices across states. This comparison would usually be invalid, because the fee-for-service programs serve different populations and have different rules on policy adjustors, wage area adjustments, etc. If DHCS wanted to compare its rates to those of New York, Texas, Montana, South Carolina, a more valid approach would be create a weighted average of payment rates for common APR-DRGs.

# 3 DRG Base Price

## 3.1 DRG Base Price

### Box 3.1.1 Remaining Decision before Implementation

Set hospital-specific DRG base prices, taking into account changes in payment levels between 2009 and 2013, the remote rural hospital list, and the documentation, coding and capture adjustment.

The DRG Base Price is the single most important number in a DRG payment method. When multiplied by the DRG relative weight, the result is the DRG base payment. For APR-DRG 139-1, pneumonia, the DRG base payment would  $0.3886 \times \$5,000 = \$1,943$  or  $0.3886 \times \$7,000 = \$2,720$  depending on whether the base price were \$5,000 or \$7,000. As the example makes clear, the DRG base price is the single most important determinant of the overall payment level. We have modeled the new payment method as budget-neutral; see Section 3.2.

Some states use a single statewide base price for all hospitals, which certainly has the advantage of simplicity. But the size and diversity of California leads us to recommend variation by hospital in two ways:

- **Wage areas.** As Medicare does, hospitals in different geographic areas would receive different base prices in order to reflect prevailing wage levels. See Section 3.3.
- **Remote rural hospitals.** Hospitals defined as remote rural hospitals would receive a higher DRG base price than they otherwise would have, in order to protect access to care. See Section 3.4.

The DRG base price is also an appropriate route for adjusting payments in anticipation of improvements in documentation, coding and capture of diagnosis and procedure codes. We recommend a 2.5 percent adjustment to the DRG base price, to be made within the context of a “casemix corridor” that protects both the hospitals and the Medi-Cal program against unanticipated changes in casemix. See Section 3.5.

Because implementation of DRG payment, though budget-neutral overall, is likely to result in significant increases or decreases in payment for individual hospitals, we also recommend a three-year transition period in which hospital-specific base prices would be set with the goal that payment would not increase or decrease by more than 5 percent per year. See Section 3.6.

## 3.2 Budget Target

Implementation of DRG payment is intended to be budget-neutral, by statute.<sup>26</sup> Simulations are being done using CY 2009 utilization and payment data and an assumption of budget neutrality. Total payments to be made in 2013 will depend on changes in baseline payment levels between 2009 and 2013, the total number of stays in fee-for-service Medi-Cal in 2013, and on legislative appropriations.

## 3.3 Variations in the DRG Base Price by Wage Areas

Medicare varies its DRG base price (“standardized amount”) by hospital depending on the local wage area index. For DRG payment, some states use the Medicare wage areas while others use a single statewide base price. Table 3.3.1 shows the Medicare hospital wage area indices for California for federal fiscal year 2012. The values are intended to reflect the differentials in the local market wages for clinical staff that hospitals employ. The range in California is 42 percent, that is, nursing wage levels in the Santa Cruz area (1.6996) are 42 percent higher than in San Diego, Riverside, Chico, Bakersfield, Fresno and other areas where the index value is 1.1950.

Differences in the wage index values affect only part of a DRG base price. For California, Medicare uses an estimate that wages account for 68.8 percent of hospital cost. For example, if the DRG base price were \$6,000 then a hospital in Bakersfield would be paid  $[(68.8 \text{ percent} \times \$6,000 \times 1.1950) + (31.2 \text{ percent} \times \$6,000)] = \$6,805$  while a hospital in Santa Cruz would be paid  $[(68.8 \text{ percent} \times \$6,000 \times 1.6996) + (31.2 \text{ percent} \times \$6,000)] = \$8,888$ . As the example makes clear, use of a wage area is necessarily redistributive among hospitals. As a matter of arithmetic, the fact that 77 percent of all stays are concentrated in the three main Southern California areas with a wage index of approximately 1.20 means that a decision on use of wage areas would have only a minor impact on Southern California hospitals. The decision would have more impact on hospitals in higher-wage areas, such as the Bay Area and Silicon Valley.

At the national level, the principle of varying the base price to reflect differences in local wage levels is very well accepted. The mechanics, however, are another story. There has been a lot of controversy, which is well summarized in a recent Institute of Medicine report.<sup>27</sup> One concern has been that the wage areas have sharply defined boundaries, so the base price can vary substantially for two hospitals physically close to one another. This has led many hospitals to appeal to Medicare to be reclassified into an adjoining wage area; there also have been various “ad hoc legislative changes” benefiting particular hospitals.<sup>28</sup> Nationwide, almost 40 percent of hospitals have been reclassified, raising obvious questions about accuracy, consistency and fairness.

### Box 3.3.1

#### Alternative Proposals Using Hospital-Specific Wage Index Values

In consultations with hospitals, two options in particular were raised as alternatives to what we recommended here. Those alternatives were as follows.

- **Use of hospital-specific wage data.**<sup>29</sup> As a general statement (but with the exceptions such as the out-migration adjustment), Medicare's uses the same wage index value for all hospitals within a given wage area. Table 3.3.1 shows the FY 2012 values. Note, for example, that the Los Angeles-Long Beach-Glendale wage area includes 90 hospitals. In calculating the index value, CMS blends together hospitals with widely varying average hourly wages, from \$26.82 to \$52.55 in this example.<sup>30</sup> In general, larger hospitals have higher hourly wages. This is true even after adjustment for differences in occupational mix. However, the occupational mix adjustment is relatively crude, taking into account only the broad categories of registered nurses, licensed practical nurses (LPNs), medical technologists, and aides. It also uses national weights that do not take into account California's mandated nurse-to-patient ratios and limits on scope of practice. Wage differences between (for example) entry-level medical floor nurses and multi-credentialed ICU nurses are not taken into account. In principle, the casemix measurement inherent in DRG payment reflects the higher costs of nursing care for sicker patients. However, hospitals with high average hourly wages say that they often compete for specialized staff at the statewide or even the national level. To reflect these factors more accurately, a proposal was made that Medi-Cal use wage index values by hospital rather than by wage area. The hospital-specific values can be calculated from data available from CMS.

A chief reason why Medicare does not use hospital-specific wage index values is that they can be circular: a hospital with high wages will then receive higher payment. Medicare's large share of the hospital market means that this risk is real and present. Even Medi-Cal fee-for-service, with its smaller share of the overall market, would have to be concerned about the cost-increasing incentives created for hospitals with high Medi-Cal utilization. We are also concerned about potential problems regarding missing data for some hospitals (including children's hospitals and Medicare critical access hospitals) and anomalies in year-to-year hospital-specific wage data.

- **Use of a California-specific labor-related share percentage.** Medicare currently uses a figure of 68.8 percent as the labor-related share of hospital costs nationwide. (By law, the value cannot exceed 62 percent for hospitals with wage area index values under 1.00, but no California hospital is affected.) The value of 68.8 percent was set by CMS effective October 1, 2009, based on labor-related costs in the hospital market basket. CMS reviews the figure each year in the inpatient hospital Final Rule.<sup>31</sup>

A proposal was made that Medi-Cal should instead use California-specific data available from OSHPD. The agency's most recent compilation of hospital financial data shows that wages and benefits account for 57.6 percent of hospital industry costs statewide.<sup>32</sup> Although using local data has appeal, in the interest of consistency we recommend following the Medicare method in its entirety.

We recommend that Medi-Cal apply wage area differentials in setting the DRG base price. Although use of wage area differentials might not be appropriate in smaller states with more homogenous labor markets, we believe that California is sufficiently large and diverse that differential base prices would improve fairness by recognizing local-area wage differences that are outside a hospital's control. In putting this policy into operation, we also recommend that Medi-Cal adopt the Medicare method. That is, Medi-Cal would adopt the wage area boundaries, wage area index values, the 68.8 percent labor share figure from Medicare. Medi-Cal would also use the Medicare assignments of hospitals to specific wage areas, including reclassifications of hospitals into adjacent wage areas, with the same hospital-specific adjustments that Medicare makes (e.g., the outmigration adjustment). For hospitals within the scope of the Medicare Inpatient Prospective Payment System, these hospital-specific adjustments are available in the annual "impact file" made available on the CMS website.<sup>33</sup> For California hospitals not listed in the Medicare impact file, we recommend use of the wage area index value for the hospital's physical location. Appendix B to this document has a list of the hospital-specific wage area index values used in Medi-Cal payment simulations as of April 2012; please note that these values are subject to correction before implementation.

For out-of-state hospitals, we recommend that Medi-Cal use Medicare's national wage index value, that is, 1.00. In general, wage areas within the border states are close to 1.00. In Nevada (855 Medi-Cal stays), the range of index values is 1.0000 to 1.1635. In Arizona (581 stays), the range is 0.8770 to 1.2308. In Oregon (396 stays), it is 1.0273 to 1.1391. In other states (319 stays), the average wage area by definition is approximately 1.00. For all out-of-state stays, the DRG payment will mean that hospitals get paid more for sicker patients, a key element in ensuring access and being fair to hospitals.

Although the details of the Medicare method are open to debate, we recommend against Medi-Cal trying to develop its own wage area differential policy. Quite simply, developing a California-specific methodology likely would be as expensive, time-consuming, and contentious as developing a new national policy. We do recommend that the Department monitor developments in Medicare's wage area policy going forward. For example, the Department of Health and Human Services has just sent a report to Congress describing the benefits of a Commuting Based Wage Index, but noting that its implementation would require statutory changes, regulatory changes and new data collection efforts.<sup>34</sup>

Table 3.3.1

## Medicare Wage Areas in California

Wage Area	FFY 2012 Medicare Wage Index Values	CY 2009 Medi-Cal Stays	% of All Stays

<b>Total</b>		<b>446,715</b>	<b>100%</b>

*Notes:*

- 1 Total stays refer to the simulation baseline dataset.
- 2 Stays by wage area refer to the hospital's physical location, not necessarily the wage area assigned to the hospital by Medicare.
- 3 Source for the wage area index levels is [www.cms.hhs.gov/AcuteInpatientPPS/01\\_overview.asp](http://www.cms.hhs.gov/AcuteInpatientPPS/01_overview.asp), and then choose Table 4A under "Acute Inpatient--Files for Download."
- 4 The wage index is the Medicare wage index associated with the wage area. The wage index may differ for some hospitals in a given wage area due to Medicare adjustments at the hospital-specific level.

## 3.4 Variations in the DRG Base Price by Hospital Characteristics

### 3.4.1 Overview

#### Box 3.4.1.1 Remaining Decisions before Implementation

- Finalize the list of specific hospitals that meet the criteria for designated NICU hospitals
- Set the differential in neonatal policy adjustors between hospitals with designated NICUs and other hospitals

In addition to wage area, it is also possible to vary payment by hospital depending on peer group definitions. Numerous variations are conceivable, including special provisions for rural hospitals, teaching hospitals, small hospitals, children's hospitals, public hospitals, disproportionate share hospitals, etc. Medicare currently or in the past has had special payment provisions for approved teaching hospitals, disproportionate share hospitals, hospitals in frontier states, children's hospitals, cancer hospitals, critical access hospitals, rural referral centers, sole community hospitals, essential access community hospitals, Medicare-dependent small rural hospitals, and low-volume discharge hospitals.<sup>35</sup> Since Medicare is so well-known, it may be instructive to review the driving factors behind most of these Medicare provisions.

- ***Groupers appropriateness.*** When Medicare implemented prospective payment in 1983, the CMS-DRG grouping algorithm was much less sophisticated than DRG versions developed afterward. In particular, CMS-DRGs did not adequately reflect the cost to hospitals of the most medically complex patients. Because many of these patients were treated at teaching hospitals, an adjustment for "indirect medical education" cost was added. Similar reasoning led to the exclusion of cancer hospitals from the prospective payment system. As well, since Medicare focused on the Medicare population, relatively little effort was put into making CMS-DRGs appropriate for children with complex medical conditions. Excluding children's hospitals from CMS-DRG payment was an obvious decision for Medicare.
- ***Concerns over patient access.*** With Medicare representing about 40 percent of inpatient stays and about 50 percent of hospital inpatient revenue nationwide, the federal program has always been sensitive to the impact its rates can have on the financial viability of hospitals. This sensitivity has been particularly acute in rural areas, where closure of the local hospital could put access barriers in front of Medicare beneficiaries. These hospitals are typically, but not necessarily, small in terms of bed size.
- ***Targeted provisions.*** In every Congress, numerous bills would tweak the definitions used in the Medicare prospective payment system, typically with the intention of increasing payment to a specific subset of hospitals. One criterion for rural referral center designation, for example, is to be a rural osteopathic hospital

with at least 3,000 discharges. The provisions that are enacted are not always easily integrated into existing law, which helps explain the web of overlapping definitions listed above.

In light of almost 30 years of Medicare precedent as summarized above, what should the Medi-Cal program do? First, we recommend reliance on the policymaking principles listed in Section 1.3. For present purposes, the most pertinent are access, efficiency, reducing administrative burden, and simplicity. Second, we pose the question: Why do Medicaid programs make payments to hospitals? Our answer, as argued more fully elsewhere,<sup>36</sup> is to enable access to quality care. Oftentimes, enabling access for beneficiaries also means providing financial support for hospitals. Nevertheless, we recommend a focus on access from the beneficiary's perspective, not on need for revenue from the hospital's perspective. In any case, fee-for-service Medi-Cal is expected to account for only about 12 percent of California hospital discharges and a lower percentage of inpatient revenue,<sup>37</sup> which limits the program's power to support the financial viability of hospitals even if this were an explicit policy goal. We also note that Medi-Cal makes substantial supplementary payments to support hospitals that serve a disproportionate share of Medi-Cal and uninsured patients.

From the beneficiary's perspective, access issues are typically split into those related to type of care and those related to geographic location. With regard to level of care, the situation today is much less problematic than what faced Medicare in 1983. This progress reflects improvements in hospital diagnosis and procedure coding and in DRG grouping. Between 1983 and 2007, Medicare continually sought to improve the accuracy of CMS-DRGs. In 2007, Medicare replaced CMS-DRGs with MS-DRGs in order to more accurately pay for medically complex patients, such as those treated by teaching hospitals and other large, urban medical centers. APR-DRGs represent an improvement over MS-DRGs even for a Medicare population and were specifically designed by 3M Health Information Systems and the National Association of Children's Hospitals and Related Institutions to apply to obstetric, newborn and pediatric patients, including newborns and children with complex medical conditions (Section 2.2).

At this time, we do not see an access issue in terms of type of care that would justify special payment provisions (e.g., a higher DRG base price or exclusion from DRG payment altogether) for any subset of hospitals, with one exception. The exception is that hospitals with designated neonatal intensive care units (those capable of neonatal surgery) may receive a higher policy adjustor on sick baby stays than other hospitals. (See Table 3.4.1.1). The DHCS goal is to help ensure the continued financial viability of these units.

Access in geographic terms is a less straightforward question. For beneficiaries, access to a local hospital is not only a matter of convenience but also of health, most obviously in an emergency but also in terms of facilitating regular and coordinated care. In keeping with our focus on the beneficiary's perspective, we emphasize distance between hospitals as a measure of access, regardless of hospital size. In practice, rural hospitals tend to be small hospitals, but if a hospital happens to have more than 25 or 50 beds we believe it should still qualify for additional payment if it enables access for rural residents. We also see considerable benefit in avoiding the confusion and complexity of the Medicare distinctions between critical access hospitals, Medicare-dependent hospitals, rural referral centers, etc.

Table 3.4.1.1

## Hospitals with Designated Neonatal Intensive Care Units

<b>Designated NICU hospitals</b>					<b>12</b>
<b>Designated NICU children's hospitals</b>					<b>8</b>
<b>All designated NICU hospitals (DRG definition)</b>					<b>20</b>
<i>Notes:</i>					
1. Hospitals are included in this table if they meet the Medi-Cal definition of designated NICU hospital. All statutorily defined children's hospitals fell within this definition.					
2. Assignment of hospitals to the list of hospitals with designated neonatal intensive care units (those capable of neonatal surgery) is subject to correction before implementation of the DRG payment method.					

## 3.4.2 Remote Rural Hospitals

### Box 3.4.2.1 Remote Rural Hospital

A remote rural hospital is at least 15 miles in driving distance from the nearest general acute care hospital that has at least a basic level emergency room.

Notes:

- A hospital is first considered a rural hospital based on the OSHPD list for defining rural hospitals.
- Rural hospitals that operate under a combined license with a non-remote rural hospital and that bill under one NPI would not be considered remote rural hospitals.

There are several ways to define rural, with one option being “non-urban,” that is, outside a metropolitan statistical area. Another option is the definition used by OSHPD. But our focus is on access in terms of remoteness. Beneficiaries in rural areas may have good access to hospitals in adjacent urban areas, for example. Similarly, a rural area could contain two hospitals close to each other. In both situations, rural residents would not face an obvious access issue. We therefore focus on distance between a rural hospital and the next closest hospital as the best measure of the extent to which rural residents rely on a particular hospital.

We use a criterion that a rural hospital at least 15 miles from another hospital that has at least a basic level emergency room would be considered a “remote rural hospital” for purposes of the DRG payment method (Box 3.4.2.1). Although any chosen number could obviously be lower or higher, we have chosen to use a definition on the inclusive end of the range (that is, more hospitals are likely to be included in the definition and therefore receive the higher payment level). Medicare uses 35 miles in defining critical access hospitals (or 15 miles in mountainous terrain or areas without primary roads); 15 or 25 miles in defining rural low-volume discharge hospitals; and 25 or 35 miles in defining sole community hospitals. In selecting 15 miles, we are essentially saying that a desirable density of hospitals would be no more than 15 miles apart. (Actual density, of course, depends on where hospitals have been built.)

Table 3.4.2.1 shows the rural hospitals, stays, and estimated hospital cost of care that would fall under the OSHPD definition of rural hospitals, sorted by driving distance so that hospitals defined as remote rural hospitals are easily identifiable. (The numbers refer to actual Medi-Cal fee-for-service stays in 2009, except for a very small number of stays that are modeled as being transitioned to managed care by 2013.) We note that every Medicare critical access hospital (CAH) would fall into our definition, as would some hospitals that are too large to meet the Medicare CAH criteria but are nevertheless at least 15 miles away from the closest hospital.

### Box 3.4.2.2 Remaining Decisions before Implementation

- Finalize the list of specific hospitals that meet the criteria for remote rural hospitals
- Set the DRG base prices applicable to remote rural hospitals

The next question is what special payment provision should apply to remote rural hospitals, as defined. Medicare, most notably, pays critical access hospitals 101 percent of allowed cost. Instead, for Medi-Cal services provided at those Medicare denoted critical access hospitals, we recommend payment by DRG. One reason is that the California Legislature explicitly included Medicare critical access hospitals within the scope of DRG payment;<sup>38</sup> the extension of legislative intent to our (overlapping) definition of remote rural hospitals is obvious. As well, the fundamental incentive to hospitals of cost reimbursement is to increase cost. This is a problematic payment policy for a method expected to be in place for 10, 20 or more years. Instead, we recommend that rural hospitals that can reduce their costs be rewarded with the increased margins that result from the fact that DRG payments are not tied to hospital-specific charges or cost.

We do recommend that remote rural hospitals receive a higher DRG base price than other hospitals. The base price would be set to hit a specified percentage of cost for the remote rural hospitals as a group (not for each hospital). We recommend 95 percent of cost; although it would not cover the full cost of care for this group, it would be notably higher than the pay-to-cost ratio of approximately 77 percent (excluding supplemental payments) that would apply to other hospitals.

In terms of the mechanics of payment, the CA-MMIS functionality would include a DRG base price as a field on the provider file. In principle, this functionality would enable hospital-specific base prices for every hospital that serves Medi-Cal. Although that is not the intention, the flexibility will easily accommodate changes in hospital-specific base prices that stem from changes in wage areas, rural designation, or transition considerations. Hospital-specific base prices would be calculated outside the MMIS and then loaded into the hospital table. For remote rural hospitals, the base price would reflect first the wage area value (which equals 1.1950 for rural California as of January 2012) times whatever hospital DRG base price would yield estimated payment equal to the target percentage of cost for the group of remote rural hospitals overall. Not all rural hospitals are in the “rural” wage area. Those that are in the “urban” wage areas would be paid using the applicable urban wage index.

1 Hospitals are included in this table if they meet the OSHPD definition of rural. All Medicare critical access hospitals fell within this definition.								
2 Hospitals that did not have any stays in the simulation baseline dataset are included in this table (shown with zero stays and zero estimated hospital cost). In addition, rural hospitals that operate on a combined license with a non-remote rural hospital are not considered rural remote.								
3 Stays and estimated hospital cost refer to Medi-Cal fee-for-service stays in the simulation baseline dataset.								
4 Driving distance is based on information provided by OSHPD. "California Licensed Healthcare Facilities. January 2006. California Health and Human Services Agency, Office of Statewide Health Planning and Development, Sacramento CA. Updated March 24, 2011.								
5 If the nearest listed general acute care hospital does not operate at least a basic level emergency room, then the distance in miles was modified to reflect the nearest general acute care hospital that did. (This mileage estimation was done using Google Maps - ©2012 Google)								
6 Assignment of hospitals to the list in this table is subject to change before implementation of the DRG payment method.								

## 3.5 Documentation, Coding and Capture Adjustment

Under a DRG payment method, overall payment for a hospital equals the volume of stays times casemix times the DRG base price, plus certain other payments and adjustments. Other things equal, a 1 percent increase in measured casemix will result in a 1 percent increase in payment.<sup>39</sup> Measured casemix may increase because of “real” changes in patient clinical conditions or because of improved documentation and coding on the claim form. Measured casemix may also increase due to improvements in the capture of clinical information by the claims processing system. Payers such as Medicare and Medicaid typically want to pay for increases in real casemix but not for changes due to better documentation, coding and capture. Payers therefore may make a “documentation, coding and capture (DCC) adjustment” that reduces the DRG base price in anticipation of casemix increases due solely to improved documentation, coding and capture.

In California, it remains important for Medicaid to address casemix increases attributable to better documentation, coding and capture. Reasons include: control over payments, ease in budget predictability, and the ability to account for deviations from the budget neutrality goal.

The first question is whether the change in payment using DRGs can be expected to result in increases in measured casemix that go beyond changes in real casemix. If yes, the second question is, what action should the Department take so that payment increases are driven only by changes in real casemix?

### 3.5.1 Real Casemix Change

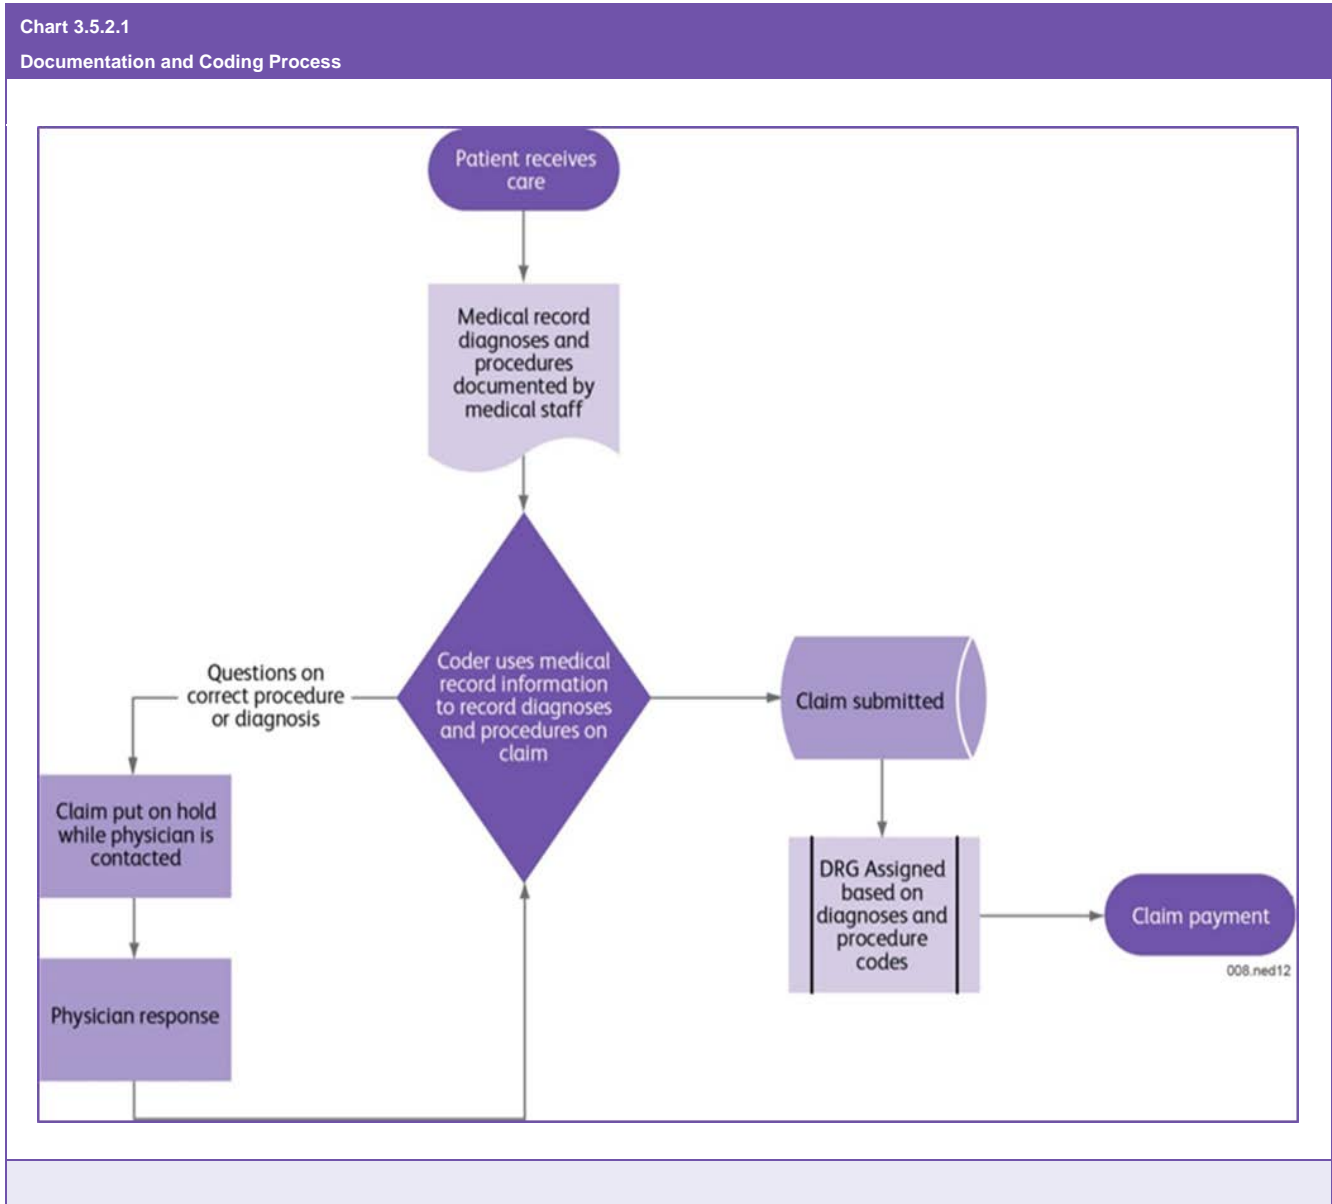

The small but focused literature on this topic reflects consensus that real casemix change is about 0.5 percent to 1.5 percent a year, averaging at the lower end of the range.<sup>40</sup>

Although much of the research dates from the 1980s and 1990s, recent evidence points in the same direction. In the ten years before Medicare’s implementation of MS-DRGs—a relatively quiet period in terms of incentives to improve documentation and coding—reported national casemix for Medicare patients increased at a compound growth rate of just 0.1% a year.<sup>41</sup> In California, an analysis by PriceWaterhouseCoopers noted that reported casemix increased “slightly” between 2001 and 2005, that is, at a compound growth rate of 0.61% a year.<sup>42</sup> That figure presumably includes both real casemix change as well as some results from the industry’s continuing efforts to improve coding.

Over time, improvements in anesthesia techniques, drug therapy, and medical technologies have meant that sicker patients can be treated as outpatients. As a result, the patients who do get admitted have become sicker, on average. As well, hospitals today can provide more extensive treatment for many conditions than they could 10 and 20 years ago.

### 3.5.2 Documentation and Coding Process

DRG assignment depends on the diagnoses and procedures documented in the medical record, coded on the claim, captured by the claims processing system, and then input into the DRG algorithm (Chart 3.5.2.1).

- **Documentation.** A standard of professional and ethical coding practice is that if the physician does not document it, then the coder cannot code it.<sup>43</sup> Coders can read the medical record and know from low hematocrit and hemoglobin values that the patient had anemia. However, the physician has to write “anemia” on the record for these diagnoses to be coded on the claim. Moreover, DRG grouping algorithms generally assign a low DRG to vague diagnoses (e.g., “not otherwise specified”). Therefore, physicians are asked to be specific between viral and bacterial pneumonia, between acute and chronic renal failure, between mechanical ventilator use of less than or more than 96 hours, etc.

Educating physicians about better documentation is more of a challenge than educating coders. There are many more physicians than coders, physicians have many additional responsibilities, and they often are not hospital employees. It helps that physician documentation can also be important for measuring hospital quality, in physician profiling, and for medico-legal purposes. For example, surgeons care about surgical mortality rates that are risk-adjusted using diagnosis data. Suffice to say, however, that improving documentation is difficult and time-consuming. While coding practices may change in weeks or months, changes in documentation practices may take months or years.

- **Coding.** Information from the medical record is translated into specific diagnosis and procedure codes by coders. Coding, or more formally, health information management, is an increasingly professional occupation, with established standards of professional practice and ethics. Coders work every day under the understanding that codes drive payment and that inaccurate coding can constitute fraud. Unlike physicians, they typically work full-time in this area, attend regular trainings, and are either hospital employees or under contract.

Based on analysis of Medicaid data and discussions with hospital staff in several states, we understand that coding staff generally take the same approach to coding regardless of payer. In two other states where Medicaid required no more than a principal diagnosis, for example, we have nevertheless seen significant numbers of secondary diagnoses and procedures routinely submitted on claims.

In specific instances, however, coding practice is affected by the method of payment. Since Medicare is the dominant payer for inpatient care, hospital practices are heavily influenced by Medicare’s payment method. The CMS-DRG algorithm, used by Medicare until September 30, 2007, had a single list of complications and comorbidities (CC). Once a CC diagnosis was found in the medical record, then the addition of further CCs had no impact on DRG assignment. “Efficient” coding practice (as opposed to “complete” coding practice) would be to find a CC in a patient’s medical record and then move on to the next patient. A similar consideration is when to go back to the physician to request further information. For example, consider a medical record that mentions ventilator use without a number of hours. DRG assignment depends on whether ventilator use is less than or greater than 96 hours. To determine the specific procedure code, coding staff would have to put aside the claim, contact the physician, await the response, and then list the specific code. If this effort results in a higher DRG assignment, then there is a financial return to the extra effort; otherwise, there is not.

For both documentation and coding, thoroughness matters most in those clinical areas where payment is driven by DRGs. In every state, that includes cardiology, pulmonology, orthopedics and other areas where Medicare is a major payer. For obstetrics, neonatology, pediatrics and mental health, however, the financial

importance of complete coding will depend on whether Medicaid, BlueCross BlueShield and other non-Medicare payers use DRG-based payment. We expect to see improvements in documentation and coding in these areas.

- **Claims processing.** Even if all of a patient's medical conditions are included on the claim, not all diagnoses and procedures may be captured by the payer's claims processing system. In principle, hospitals can submit up to 25 diagnosis codes and 25 procedure codes. Medicare, however, traditionally was limited to the principal diagnosis, up to eight secondary diagnoses, and six procedure codes.<sup>44</sup> It now can process up to 25 diagnosis codes and 25 procedure codes, which will add impetus to hospital efforts to increase their own coding completeness.

Medicaid programs vary widely in how many codes they can accept. Mindful of these limitations, hospitals sequence secondary diagnosis codes so that more important codes (e.g., congestive heart failure) are listed before less important codes (e.g., benign hypertension). The American Hospital Association looked at this question as part of its comments on the Medicare documentation and coding adjustment. Using data from four large states where hospital claims include up to 25 diagnoses, it found that only 0.25 percent of claims had a Medicare CC or major CC appear for the first time in positions 10 through 25. Another commenter, however, did offer evidence from New York State that increased capture of diagnoses would increase casemix.<sup>45</sup>

- **DRG algorithms.** DRG algorithms differ in how they use diagnosis and procedure codes. As mentioned above, CMS-DRGs included a single list of complications and comorbidities. Once a CC was listed on the claim, additional CCs made no difference to the CMS-DRG assignment.

Since 2007, Medicare has used Medicare Severity-DRGs (MS-DRGs), which have both a CC list and a major CC list. The change in DRG algorithm saw an increase from 538 CMS-DRGs to 745 MS-DRGs. As distinctions among DRGs become finer, there is more opportunity for changes in coding to affect DRG assignment. Hospitals then have a financial incentive to improve their coding in order to capture a major CC if it is present and, if not, then at least a CC.

APR-DRGs do not have a CC or major CC list. Instead, for each given condition, severity is measured as mild, moderate, severe or extreme based on the number, nature and interaction of secondary diagnoses. There are also 1,256 DRGs. The algorithm is more sophisticated than CMS-DRGs or MS-DRGs, which makes it more accurate in capturing patient acuity and hospital resource use, especially for the patients with the most diagnoses and procedures.<sup>46</sup>

Because the distinctions among the 1,256 DRGs are finer than among the 745 MS-DRGs, there are even more opportunities for coding to affect payment. For example, the relative weight for APR-DRG 139 (pneumonia) increases in steps from 0.3886 to 0.5773 to 0.8937 to 1.7342 depending on what diagnoses and procedures are reported. That is, payment for severity 4 is 3.5 times higher than for severity 1. If the DRG base price is (for example) \$7,000 the financial return is obvious when additional documentation pushes a stay into a higher severity level.

Changes over the years – from cost reimbursement to CMS-DRGs to MS-DRGs to APR-DRGs – have created many opportunities for hospitals to increase revenue by improving documentation and coding. Hospitals often include clinical documentation improvement programs as part of their business organization.<sup>47</sup> Many consultants have been training hospital staff about how to code claims more completely and how to sequence diagnoses and procedures in order to receive the most payment.

Documentation and coding improvement is sometimes referred to pejoratively as code creep, DRG creep or upcoding. Barring specific evidence of fraud or abuse, we do not use these terms. Documentation and coding improvement is an appropriate and predictable response to the financial incentives set by payers. Indeed, better data enables better care throughout the health care system. The distinction, as noted above, is that it is inappropriate for payment to increase simply because of better documentation, coding and capture.

### 3.5.3 Applicability in California

Medi-Cal DRG rates for January 1, 2013, are being based on CY 2009 data, with appropriate allowance for the lag in claims submission. To the extent that hospitals take the same coding approach for all payers, Medicare's 2007 shift from CMS-DRGs to MS-DRGs has probably meant more complete coding for Medicaid claims as well, although a specific analysis has not been undertaken.

Because the California MMIS currently stores only two diagnosis codes and two surgical procedure codes on each inpatient claim with no present-on-admission (POA) indicator available, for this project the Department of Health Care Services created a merged file that also included up to 25 diagnosis codes and 21 procedure codes that hospitals submit to the Office of Statewide Health Planning and Development (OSHPD).<sup>48</sup> The analytical dataset created for this project includes 369,150 stays where the OSHPD data were matched to CA-MMIS data and 36,423 stays where a match was not possible. (These counts exclude stays for newborns that were derived from the mothers' claims.)

There are five key reasons to expect documentation and coding improvement as California moves from cost-based or negotiated rates to APR-DRGs:

- **Increased financial incentive.** Although hospitals do submit large volumes of diagnosis and procedure codes to OSHPD, there is not a strong financial incentive to do so. Under APR-DRG payment, there will be.
- **DRG algorithm.** APR-DRGs represent a sophisticated algorithm that makes extensive use of diagnosis and procedure codes. Incremental changes in diagnosis and procedure coding completeness can drive stays into higher-paying DRGs to a greater extent than under MS-DRGs or other DRG algorithms.
- **Medicaid care categories and market share.** Although the use of MS-DRGs by Medicare gives hospitals an incentive to code completely, that incentive is strongest in adult cardiology, orthopedics, gastroenterology and other clinical areas where Medicare has a substantial market share. But when APR-DRGs are implemented for Medi-Cal on January 1, 2013, we expect 78 percent of all stays to be for normal newborns, sick newborns, pediatrics and obstetrics. In these lines of business, the Medicare market share is negligible and the Medi-Cal share approximates 50 percent (including both fee-for-service and managed care). For sick newborns and pediatrics with complex medical conditions in particular, more complete coding likely will lead directly to increased payment. In

Section 6.7, for example, we will see that the APR-DRGs for sick newborns have noticeably longer lengths of stays in the Medi-Cal dataset than nationwide—a finding that likely reflects a mix of true differences in length of stay and undercoding of neonate claims.

- **Claims not crosswalked to OSHPD.** The 36,423 CA-MMIS claims without an OSHPD match were included in the analytical dataset, unless excluded for technical reasons.<sup>49</sup> Since these claims had at most two diagnoses and two procedures, we know that there must be some under-statement of APR-DRG assignments. In analyzing these 36,423 claims, we concluded that roughly half probably would not have had significant additional diagnosis or procedure codes even if a match had been possible. We say that because of the claims that did not match, 13% had only one diagnosis on the CA-MMIS claim anyway, 16% were normal newborns with charges less than \$30,000, and 23% were for stays of two days or less. The other half, however, may well have missing diagnosis and procedure codes that would make a significant difference to APR-DRG assignment.<sup>50</sup>
- **Derived claims for normal newborns.** As discussed in the *Summary of the Analytical Dataset*, normal newborns are currently included on their mothers' claims, but will be billed separately under DRG payment. The simulation baseline dataset therefore includes 132,592 normal newborn claims derived from the mothers' claims. All these babies were assigned to APR-DRG 640-1, that is, to the healthiest DRG. In fact, some proportion of them can be expected to be grouped to higher severity levels for APR-DRG 640 or to other neonatal DRGs.

### 3.5.4 Experience from Other Payers

The most pertinent experience is from the Maryland all-payer system, Medicare and Pennsylvania Medicaid. There was considerable study of Medicare experience in the 1980s. When Maryland switched its casemix algorithm from CMS-DRGs to APR-DRGs in 2005, additional evidence was generated. When Medicare moved from CMS-DRGs to MS-DRGs in 2007, it examined its own experience as well as that of Maryland.

- **Maryland experience.** Maryland has a unique, “all-payer” system under which the same payment method is used for all hospitals by all payers (including Medicare, under a waiver of federal law). Payment is based on regulated charges, with higher charges allowed for sicker patients. “Sickness” is measured using DRGs. For many years, CMS-DRGs were used as the grouping algorithm. On July 1, 2005, however, the state adopted APR-DRGs. Before that date, three teaching hospitals – including Johns Hopkins and the University of Maryland, both of which have high volumes – had been paid using APR-DRGs. In addition, hospitals knew that APR-DRGs were coming and that casemix increase would be limited by a “governor” that compared casemix under APR-DRGs with casemix before APR-DRGs.

In 2005-06, measured casemix grew by 4.2 percent, of which 1.0 percent to 1.5 percent was estimated to be real.<sup>51</sup> Documentation and coding improvement was therefore estimated to be 2.7 percent to 3.2 percent. In 2006-07, measured casemix grew by 2.1 percent. If we use the same range of 1.0 percent to 1.5 percent for real change, then coding improvement would represent 0.6 percent to 1.1 percent. Maryland also reported that the percentage of stays with 15 diagnoses (its maximum) increased rapidly from 7 percent in FY 2004 to 13 percent in FY 2005, 18 percent in FY 2006, and 21 percent in FY 2007.

By 2007–08, staff of the Maryland Health Services Cost Review Commission (HSCRC) believed that coding change had stabilized, with measured casemix change that year estimated at less than 1.0 percent.<sup>52</sup> The Commission approved HSCRC staff recommendations for the removal of the governor and a 1.0 percent casemix cap in April 2008. HSCRC staff also considered the potential for continued improvements in coding and increases due to a change in the number of diagnoses collected (from 15 to 30).

Between 2009 and 2011, Maryland's allowance for casemix growth adjustment has been consistently set at the lesser of the actual increase or a limit of 0.5 percent. According to HSCRC staff, this approach allows for variability in a hospital's casemix growth from year to year and does not inappropriately disadvantage hospitals that experience a decline in a given year. For example, a hospital with a negative casemix growth of -0.5 percent one year followed by positive casemix growth of 1.5 percent would not be subject to the adjustment on the year of the decline.<sup>53</sup>

For 2012, the Commission has noted that inpatient casemix growth has stabilized, after a period of prolonged growth limited by a governor.<sup>54</sup>

To summarize, the Maryland experience indicates that the change from CMS-DRGs to APR-DRGs did result in a significant casemix increase due to improved documentation and coding beyond "real" casemix growth. In addition, Maryland's experience also shows that significant casemix growth occurs during the first few years of the change in DRG algorithm with stabilization after the fourth year. Unlike Medicare, Maryland was successful in implementing control of casemix growth through the use of a governor until increases in measured casemix returned to the historical growth trend.

- **Medicare experience.** When Medicare changed from cost reimbursement to CMS-DRGs on October 1, 1983, a major impact was that it "brought medical records out of the basement."<sup>55</sup> Even if not always literally true, the statement underscores the reality that improved coding became a relatively easy way to increase revenue and profit margins. Starting from a low base, measured casemix rose an average of 3.1 percent a year from 1981 (before DRGs) to 1987.<sup>56</sup> Throughout the 1990s, measured casemix stabilized and even fell slightly in 1998 and 1999, during a period of heightened scrutiny from the federal investigators.<sup>57</sup>

When Medicare began planning to implement a new severity-adjusted DRG algorithm to replace CMS-DRGs, it knew it had to plan for another round of improved coding. The topic was discussed at length in the proposed and final rules for FFY 2007 and FFY 2008. Based on an analysis similar to that in this section, the final rule put in place a 4.8 percent adjustment that would be implemented over three years, that is 1.2% in FFY 2008, 1.8 percent in FFY 2009 and 1.8 percent in FFY 2010.<sup>58</sup> The American Hospital Association opposed these adjustments, calling them "behavioral offsets" (a term CMS did not use) and saying that Maryland's experience with APR-DRGs was not an indication of what would happen with MS-DRGs.<sup>59</sup>

In an unusual development, Congress passed legislation in September 2007 to overrule CMS and reduce the adjustments to 0.6 percent in FFY 2008 and 0.9 percent in FFY 2009.<sup>60</sup> Congress specified that if changes in coding

completeness exceeded these levels then CMS could make recoupments (with interest) and implement future adjustments in FFY 2010 and FFY 2011.

In the end, it turns out that CMS's original projections may have been understated, if anything. CMS analysis, corroborated independently by the Medicare Payment Advisory Commission (MedPAC), estimated the impact of improved documentation and coding at 5.8 percent over two years, or 2.9 percent a year. That is more than the 3.0 percent ( $1.012 \times 1.018 = 1.030$ ) that CMS had projected for the two years.<sup>61</sup> However, CMS postponed the application of any documentation and coding adjustments for FFY 2010, including the standard adjustments and the recoupment from FFY 2008 and FFY 2009. Although required by law to recover these overpayments, CMS has delayed implementation into 2012.<sup>62 63</sup>

In the final rule for FFY 2012, CMS indicated that it will apply a prospective adjustment of 2.0 percent and a recoupment adjustment to payments of 2.9 percent.<sup>64</sup> As part of the proposed rule comment period, MedPAC agreed with CMS assessment regarding the effect of the documentation and coding improvement on payments and the need to correct overpayments, but recommended "slowing the pace of the corrections so hospitals would receive a net 1 percent update in (FFY) 2012. CMS implemented a temporary 2.9 percent reduction in payments in 2011 to recover half the overpayments."<sup>65</sup>

According to MedPAC, annual casemix growth under CMS-DRGs in the years before MS-DRG implementation ranged from -0.8 percent to 1.0 percent, averaging 0.1 percent a year. The Commission concluded that the increase in reported casemix under MS-DRGs reflected documentation and coding improvements and not an actual shift toward patients whose care required greater resources.<sup>66</sup> This was particularly evident in the Commission's comparison study of claims data for 2006, 2007, 2008, and 2009, where cases within the same MS-DRG shifted from lower severity to higher severity.<sup>67</sup>

The American Hospital Association disputed the CMS methodology and results.<sup>68</sup> Nevertheless, its "conservative" (upper bound) estimate is that the documentation and coding impact was 1.3 percent in FFY 2008 and 3.6 percent in FFY 2009, i.e., 4.9 percent over two years or 2.4 percent a year. These figures imply increases in real casemix of 1.5 percent in FFY 2008 and 0.5 percent in FY 2009, which are in the range of historical experience.<sup>69</sup>

Under either view of the controversy – CMS and MedPAC on the one hand or AHA on the other – the shift from CMS-DRGs to MS-DRGs did result in increases in measured casemix due to documentation and coding improvement. The disagreement is over the magnitude.<sup>70</sup>

- **Pennsylvania experience.** Pennsylvania implemented payment by APR-DRG effective July 1, 2010. Casemix was expected to be in the range of 1.02 to 1.04. Instead, after six months average casemix was found to be 1.067. The program therefore made an across-the-board adjustment to relative weights of 0.9747 (=  $1.04 / 1.067$ ) in order to bring spending back toward the level originally expected. The adjustment was made in October 2011 retroactive to July 1, 2011.<sup>71</sup>

## 3.5.5 Implications and Recommendations

### Box 3.5.5.1 Remaining Decisions before Implementation

- Set the value of the documentation, coding and capture adjustment.
- Decide on the recommendation to apply a casemix “corridor” and, if so, with what high and low values.

The most obvious implication from the above analysis is that documentation and coding do improve in response to changes in payment methods. To assert, as AHA did in 2007, that a documentation and coding adjustment is a “backdoor budget cut” in hospital payment strikes us as inaccurate.<sup>72</sup> As CMS has argued repeatedly, it would be financially irresponsible of a payer to ignore the logic and the evidence that show that documentation and coding improve in response to stronger financial incentives.

To allow for changes in measured casemix amidst the uncertainty of implementing a new payment method, we recommend the following steps:

1. **Documentation and coding adjustment.** In anticipation of improved documentation and coding by hospitals, and in recognition that the simulation dataset in all likelihood understated casemix for newborns and possibly other care categories, we include a documentation and coding adjustment of 2.5 percent. That is, before taking into account real casemix change we would expect measured casemix in 2013 to be  $0.61 \times 1.025 = 0.625$ . The value of the documentation and coding adjustment – 2.5 percent – cannot be specified with certainty. However, we believe it is a reasonable estimate, based especially on the experience of Medicare, the Maryland all-payer rate-setting system and the Pennsylvania Medicaid program.
2. **Real casemix change.** We use a real casemix change number of 0.5 percent per year between 2009 and 2013. That is, measured casemix in 2013, after taking into account documentation and coding improvement, would be expected to be  $0.625 \times 1.005^4 = 0.638$ .
3. **Use of a “casemix corridor.”** Because of the inherent uncertainty in forecasting casemix and payments in the first year of DRG payment, we recommend use of a casemix corridor. For example, the corridor could be plus or minus 1 casemix point, i.e., 0.628 to 0.648. In percentage terms, the corridor would be 1.6 percent more or less than the expected casemix of 0.638. On a base of \$2.6 billion, 1.6 percent equals plus or minus \$41 million. A corridor protects both the hospitals and the Department against forecast errors in casemix. As noted above, the figure of 2.5 percent for the documentation and coding adjustment cannot be precise. Use of a casemix corridor reduces the impact of imperfect foresight. If, in fact, documentation and coding improvement is less than expected and reported casemix turns out to be, e.g., 0.620, then the DRG base price would be increased in order to increase funding to hospitals. If, on the other hand, casemix were higher than expected, e.g., 0.650, then an adjustment could be made in order not to exceed the Department’s budget target.

Table 3.5.5.1 Casemix Calculation Corridor Examples		
	Calculation	Average Casemix
<b>Expectation of 2013</b>		
1	2009 actual (simulation dataset)	0.6108
2	If real casemix change = 0.5% a year	$0.6108 \times (1.005^4)$
3	If documentation, coding, capture improvement = 2.5%	$0.6231 \times 1.025$
4a	Set "casemix corridor" lower bound at - 2%	$0.6387 \times 0.98$
4b	Set "casemix corridor" upper bound at +2%	$0.6387 \times 1.02$
<b>Actual 2013</b>		
6	Scenario 1: forecast almost accurate => keep casemix adjustment factor at 1.00	1.0050
7	Scenario 2: casemix lower than corridor => increase casemix adjustment factor	0.9600
8	Scenario 3: casemix higher than corridor => decrease casemix adjustment factor	1.0400
Note: Specific values used in this example are subject to review and revision by DHCS.		

4. **Prospective rather than retrospective base price changes.** As a general statement, retroactive payment adjustments are to be avoided whenever possible. They are confusing, burdensome to the payer and the providers, and bedevil financial planning by all parties. Traditionally, an advantage of DRG payment has been its lack of ambiguity. The DRG base price and the relative weights are known in advance and there is no cost settlement years after the fact. The difficulties now faced by hospitals and Medicare as Medicare tries to "recoup" MS-DRG payments are a caution against trying to make retrospective changes. To the greatest extent possible, we recommend that any necessary DRG base price adjustments be made only on a go-forward basis. We note, however, that the necessity of retroactive adjustments cannot be ruled out in advance.
5. **Advance notice to hospitals.** We recommend that DHCS calculate year-to-date casemix each month in 2013 and advise the hospital industry of the findings. It usually takes several months for trends in casemix to become clear, even in a state the size of California. The reason is that higher-casemix stays tend to be longer (almost by definition) and therefore take time to be submitted. Even before a DHCS decision on a possible base price adjustment has been made, hospitals and other interested parties can make their own forecast based on measured casemix through the end of March, the end of April, etc.
6. **Analysis of casemix changes.** If measured casemix in 2013 is outside the corridor, claims analysis can illuminate the reasons. If, for example, the frequency of stays by base APR-DRG is about as expected but average severity tends to be higher, then there would be a strong implication that documentation and coding of secondary diagnoses improved. If, on the other hand, there was a noticeable change in the number of births or the number of adult cardiovascular stays, then the implication would be that the changing needs of the fee-for-service population were an important factor. For newborns, the number of claims with low reported birthweights could be significant since, other things equal, lower birthweight tends to increase casemix for babies.

7. **A “casemix adjustment factor.”** If the decision is made to increase or decrease the payment level because casemix is lower or higher than the “corridor” we recommend that the adjustment be made through a separate “casemix adjustment factor” in CA-MMIS. The DRG base payment there would be as shown in Equation 3.5.5.1.

$$(3.5.5.1) \quad \text{DRG BASE PAYMENT} = \text{PAYMENT RELATIVE WEIGHT} \times \text{DRG BASE PRICE} \times$$

CASEMIX ADJUSTMENT FACTOR

This construction would allow hospitals and other interested parties to clearly differentiate between the relative weights, the DRG base price, and the casemix adjustment factor. (This point was made during the hospital consultation process, and we thank participants for suggesting this approach.) The casemix adjustment factor would be initially set at 1.00.

Note that the casemix adjustment factor is a different concept than the documentation, coding and capture adjustment. The DCC adjustment is made *before* implementation in anticipation of the effect on measured casemix of improved documentation, coding and capture. The casemix adjustment factor is a contingency, to be used *after* implementation to adjust payment if casemix is outside the corridor described above.

## 3.6 Transition Base Prices

We recommend that the new payment method include a three-year transition period to enable hospitals to adapt to the change in payment levels. The transition would be budget-neutral overall, that is, some hospitals would receive higher payments than they otherwise would have while others would receive lower payments than they otherwise would have. The reason for a three-year period is that we expect the move to DRG payment to result in a noticeable redistribution of funds among California’s hospitals, making a longer transition more appropriate. What we propose is similar to what Medicare does with major payment changes, with transitional rates for three years and the change fully implemented in the fourth year. As a matter of semantics, we call it a three-year transition while Medicare calls it a four-year transition, but the idea is the same.

### 3.6.1 Policy Rationale

For hospitals that see increased payment levels, the move to DRGs will obviously be welcome news and not difficult to manage. For hospitals that see decreased payment levels, a transition period allows time to adjust finances and operations as need be.

For hospitals, the concern is about profit, not revenue. Medi-Cal fee-for-service payment accounts for only about 4 percent of the typical hospital’s net patient revenue,<sup>73</sup> so even a 20 percent decrease in Medi-Cal FFS revenue would mean a decrease of just 0.8 percent in net patient revenue for the typical hospital.

Any decrease in revenue goes straight to the bottom line, however. If the hospital’s profit margin had been 5 percent, then a 0.8 percent revenue reduction drops the margin to 4.2 percent, which is a 16 percent decrease in dollar terms. If the margin had been 2 percent,

then a decrease to 1.2 percent represents a 40 percent decrease in dollar terms. In general, the impact on margin is greatest when margin is low, Medicaid market share is high, and/or the decrease in Medicaid payment is large.

While recognizing the potential adverse impacts on some hospitals from decreases in Medicaid payment, we note that the DRG implementation has been modeled as budget-neutral. Other hospitals will see increased revenue and profit, which presumably will enable increased access to care. We also note that DRG payment provides larger rewards for improving efficiency than the previous payment method. Cost reductions from reduced length of stay, for example, will flow straight to the bottom line, as discussed in Section 6.7.

### 3.6.2 Calculating Transition Base Prices

#### **Box 3.6.2.1 Remaining Decisions before Implementation**

- Set the target DRG base price for each hospital, per the steps described in Sections 3.1 to 3.5.
- Calculate the budget-neutral DRG base price for each hospital and therefore the transition base prices for 2013, 2014 and 2015.
- Update the transition base prices for any change in payment levels between 2009 and 2013.

We recommend that the transition be implemented via the DRG base price. We specifically recommend against Medicare's typical practice of calculating payment the old way, then the new way, then splitting the difference. The Medicare approach would be significantly more complex, more costly, and more opaque than adjusting the DRG base price. The Medicare approach would also muddle the incentives to improve efficiency, since the previous Medi-Cal payment method rewarded long lengths of stay while DRG payment rewards short lengths of stay. In any case, treatment authorization review will no longer occur for the vast majority of days, so it would be impossible to accurately calculate what the previous payment method would have paid if it were to continue in place in 2013, 2014 and 2015.

In terms of mechanics, we make a specific recommendation in Table 3.6.2.1. One advantage of this option is that in 2012 the individual hospital CFOs would know their projected DRG base prices for 2013, 2014, 2015 and 2016, thereby enabling financial planning. These prices would be subject to change depending on overall changes in funding levels, adjustments in Medicare wage area assignments and index values, and possibly for adjustments related to differences between forecast and actual casemix. Nevertheless, each hospital would be able to model the impact of the transition base prices (and any changes to the base prices) on its own patient population.

All calculation of transitional DRG base prices would be based on the 2009 simulation dataset. Although it might be desirable to update the dataset to, say, 2011, such an update is not feasible, largely because of the challenges in matching CA-MMIS claims to OSHPD records in order to obtain the full set of diagnosis and procedure codes necessary for APR-DRG grouping.

The proposed transition mechanism is as follows. We use Simulation 10 for purposes of illustration. Although actual numbers would, of course, depend on the final payment policy decisions made by DHCS, we believe transition results will be similar to those shown here.

1. Transition base prices would apply to California hospitals only.
2. Hospitals that are expected to see a change (up or down) of less than \$50,000 would not receive transitional base prices. Such a change is similar to the financial impacts that hospitals routinely manage on a year-to-year basis (i.e., less than the cost of one nurse). Of the 350 California hospitals, about 39 are expected to fall within this category.<sup>74</sup> In Table 3.6.2.1, Hospitals A and B therefore receive the target base price in each year. Although the changes may be large in percentage terms, in dollar terms the changes would be less than \$50,000 by definition.
3. For the remaining 311 hospitals, we would start with the final DRG payment parameters (e.g., base price, outlier thresholds, policy adjustors) as approved by DHCS. For each hospital, we refer to this approved base price as the “target” base price. Table 3.6.2.1 uses Los Angeles hospitals for purposes of illustration, so the target base price is \$7,555 for all hospitals. Given those parameters, we would then calculate for each hospital the DRG base price that would have been budget-neutral for that hospital. For Hospital C, the budget-neutral base price would be \$7,835.
4. If the target base price is within 5 percent of the budget-neutral base price, there would be no transition. Hospitals C and D therefore receive the target base price starting in 2013.
5. If the difference between the target base price and the budget-neutral price is between 5 percent and 10 percent, the hospital would receive a transition base price in 2013 and the target base price in 2014 and 2015. This situation applies to Hospitals E and F.
6. If the difference between the target base price and the budget-neutral base price is between 10 percent and 15 percent, the hospital would receive transition base prices in 2013 and 2014 and the target base price in 2015. This situation applies to Hospitals G and H.
7. If the difference between the target base price and the budget-neutral price is more than 15 percent, the hospital would receive transition base prices in 2013, 2014 and 2015. This situation applies to Hospitals I, J, K and L.
8. All hospitals would receive the target base price in 2016.
9. The transition base prices would be set with the goal of limiting year-to-year changes to 5 percent until 2016, when any remaining change would take effect. For Hospital I, for example, the 2013 base price would be 5 percent less than the budget-neutral base price of \$9,540, the 2014 base price would be 10 percent less than \$9,540, and the 2015 base price would be 15 percent less than \$9,540. Any remaining impact would take effect in 2016; for this hospital, the 2016 base price would be 20.8 percent less than \$9,540. This formulation allows three years for the hospitals with the largest adverse effects from DRG implementation to make any necessary changes. This is most clear for Hospitals K and L.

10. When DRG payment policy decisions have been finalized and the transition base prices are calculated it may be necessary to slightly adjust the corridors shown here. For example, it may turn out that the money “spent” on transition base prices higher than the target base price is not exactly offset by money “saved” on transition base prices lower than the target base price. If so, then adjustments would be made to ensure overall budget neutrality. Because the various payment simulations have shown roughly equal numbers of hospitals receiving increases and decreases we expect any such adjustments to be small.

We emphasize that the transition hospital-specific base prices shown in Table 3.6.2.1 are shown at 2009 levels. For implementation in 2013, we recommend that base prices be adjusted to incorporate the impact of payment level changes between 2009 and 2012. Once the DRG payment method is in place, then base prices could change in parallel with changes in funding. For example, if a 1 percent change were put in place effective January 1, 2014, then all base prices would change by 1 percent. Similarly, changes in Medicare wage area index values (which tend to be small from year to year) would also affect hospital-specific base prices.

Table 3.6.2.1 Calculating Transition Base Prices							
Hosp	DRG Base Price	Hosp Budget Neutral	% Diff	Transition Base Prices: 5% steps, then remainder			
				2013	2014	2015	2016
<b>Absolute change &lt; \$50,000: no transition base prices</b>							
A	\$7,555	N/A	N/A	\$7,555	\$7,555	\$7,555	\$7,555
B	\$7,555	N/A	N/A	\$7,555	\$7,555	\$7,555	\$7,555
<b>Percentage change under 5% in absolute terms: no transition base prices</b>							
C	\$7,555	\$7,835	-3.6%	\$7,555	\$7,555	\$7,555	\$7,555
D	\$7,555	\$7,281	3.8%	\$7,555	\$7,555	\$7,555	\$7,555
<b>Percentage change 5% to 10% in absolute terms: transition base price in 2013</b>							
E	\$7,555	\$8,170	-7.5%	\$7,761	\$7,555	\$7,555	\$7,555
F	\$7,555	\$7,072	6.8%	\$7,425	\$7,555	\$7,555	\$7,555
<b>Percentage change 10% to 15% in absolute terms: transition base prices in 2013 and 2014</b>							
G	\$7,555	\$8,615	-12.3%	\$8,185	\$7,754	\$7,555	\$7,555
H	\$7,555	\$6,718	12.5%	\$7,054	\$7,390	\$7,555	\$7,555
<b>Percentage change over 15% in absolute terms: transition base prices in 2013, 2014 and 2015</b>							
I	\$7,555	\$9,540	-20.8%	\$9,063	\$8,586	\$8,109	\$7,555
J	\$7,555	\$6,229	21.3%	\$6,541	\$6,852	\$7,164	\$7,555
K	\$7,555	\$12,619	-40.1%	\$11,988	\$11,357	\$10,726	\$7,555
L	\$7,555	\$5,393	40.1%	\$5,663	\$5,932	\$6,202	\$7,555
<i>Note:</i>							
1 The table shows a modeling of transition base prices, all in 2009 dollar terms. Actual base prices in 2013 and following years would be adjusted for inflation, changes in funding levels, etc.							

The numbers of hospitals that will receive transitional rates will depend on the final decisions on payment policy parameters such as policy adjustors, outlier thresholds, etc. Nevertheless, from the payment simulations done to date, we expect that most hospitals will receive transitional rates for all three years. Table 3.6.2.2 shows approximate hospital counts under the various transition categories under Simulation 10.

Table 3.6.2.2 Number of Hospitals with Transition Base Prices			
	Payment Decrease	Payment Increase	All Hospitals
No transition because change < \$50,000	18	21	39
Change under 5%: no transition	10	9	19
Change 5% to 10%; transition base price in 2013 only	15	20	35
Change 10% to 15%; transition base prices in 2013 and 2014	17	15	32
Change > 15%; transition base prices in 2013, 2014, 2015	116	109	225
<b>Total</b>	<b>181</b>	<b>169</b>	<b>350</b>
<i>Note:</i>			
1 For purposes of illustration, this table shows results from Simulation 10. The actual number of hospitals receiving transitional base prices would depend on the final payment policy decisions.			
2 The count of 350 hospitals includes separate records for a hospital that was paid both by contract and by cost in 2009.			

# 4 Other Factors in Payment Calculation

## 4.1 Transfer Adjustments

### 4.1.1 Transfers to Acute Care Settings

DRG payers typically reduce payment if a transfer to an acute care setting means that the length of stay at the transferring hospital is unusually low. The typical approach is to follow the Medicare model, that is, to calculate the DRG base payment as described in Section 2.1, check if the discharge status qualifies as a transfer to another acute care setting and, if so, calculate a transfer-adjusted base payment. The actual DRG base payment is then the DRG base payment or the transfer-adjusted amount, whichever is lower. The formula for the transfer-adjusted base payment is:

$$(4.1.1.1) \text{ TSF-ADJUSTED BASE PAYMENT} = \frac{(\text{DRG BASE PAYMENT})}{(\text{OVERALL AVERAGE LOS})} \times (\text{ACTUAL LOS} + 1)$$

The effect is to calculate a per diem payment amount and pay it instead of the DRG payment if the length of stay is less than the overall average length of stay minus 1 day. If the stay is longer than that, the hospital receives the full DRG payment despite the transfer. The formula effectively pays double for the first day of care to compensate hospitals for the one-time costs of admission.

Table 4.1.1.1 shows that about 1 percent of stays would probably meet the criteria as a transfer, (i.e., discharge statuses 02 and 05). In fact, because of anomalies in discharge status values in the analytical dataset, we believe that more than 1 percent of stays will meet our definition of a transfer in the future.<sup>75</sup> Because not all transfer stays are paid the transfer-adjusted base payment, we expect the percentage of stays subject to the payment reduction in any case would be less than 3 percent.

Each DRG payer needs to decide for itself which UB-04 discharge statuses qualify as an acute care transfer. The goal is to include those statuses where it is likely that the patient will continue to receive acute care treatment while excluding those statuses that are more likely to be post-acute care. We recommend the following UB-04 discharge statuses be included:

- 02 – Discharged/transferred to a short-term hospital for inpatient care
- 05 – Discharged/transferred to a designated cancer center or children’s hospital
- 65 – Discharged/transferred to a psychiatric hospital or psychiatric distinct part unit of a hospital
- 66 – Discharges/transfer to a critical access hospital

Table 4.1.1.1			
Discharge Status			
Status	Discharge Status Description	Stays	% of All
01	Discharged home	409,111	92%
06	Discharged to care of home health service organization	11,487	3%
03	Discharged to SNF	10,715	2%
02	Discharged to another short-term general hosp	5,194	1%
20	Expired or did not recover	4,719	1%
07	Left against medical advice	2,404	1%
62	Discharged to inpatient rehab facility / unit of hosp	1,565	0.4%
63	Discharged to long term care hospital	1,468	0.3%
21	Law enforcement / prison	52	0.0%
<b>Total</b>		<b>446,715</b>	<b>100%</b>

*Notes:*

- 1 Data are the responsibility of Xerox and should not be attributed to any California state agency.
- 2 For purposes of APR-DRG grouping and making transfer adjustments, CA-MMIS would use the UB-04 values shown. The discharge statuses were derived by Xerox based on a crosswalk of OSHPD and RASS disposition values (*Summary of the Analytical Dataset*, December 2011, Table 2.7.1).
- 3 This table is based on the simulation baseline dataset.

We do not recommend that the list include discharge statuses 07 (left against medical advice) or 43 (discharged/transferred to a federal health care facility). Medicare does count 07 as a transfer, but only if the patient is admitted to another Medicare DRG hospital the same day (which would seem unlikely since the patient left the first hospital against medical advice). Status 43 includes both acute care (such as a Veterans Affairs hospital) and post-acute care (such as a VA nursing facility). On balance, we follow Medicare in not defining it as an acute care transfer.

The transfer payment adjustment only applies to the transferring hospital. The receiving hospital is paid the full DRG amount.

For average length of stay data, we recommend the use of the arithmetic average of untrimmed data from the Nationwide Inpatient Sample. Although other measures have theoretical advantages, the untrimmed arithmetic average is simpler and is also directly comparable to the average length of stay calculated from Medi-Cal paid claims data.

## 4.1.2 Transfers to Post-acute Care Settings

For certain transfers, Medicare has a “post-acute care transfer policy” that reduces payment to hospitals for a specified list of DRGs (currently 275 MS-DRGs) under some circumstances. The need for this policy arose from the disparate payment incentives facing acute care providers (paid per stay) and post-acute care providers (paid per day) for patients who needed both types of care. For example, for some DRGs such as hip replacement, Medicare reduces payment to the hospital if a stay is particularly short and the patient is discharged to a post-acute setting.

Patient discharge status codes subject to Medicare’s post-acute care transfer policy are: 03 (skilled nursing facility), 05 (cancer/children), 06 (home health), 62 (rehabilitation), 63 (long-term care hospital), and 65 (psychiatric).<sup>76</sup>

We do not recommend a similar policy for Medi-Cal. Given the very different patient characteristics of the Medicare and Medicaid populations, we do not think the benefits to DHCS would outweigh the added complexity for the hospitals and the Department. In Table 4.1.1.1, 5.6 percent of discharges are to home health, a rehab or a nursing facility, and not all of those would be for DRGs included within the definition of a post-acute transfer policy.

## 4.2 DRG Outlier Payment Adjustments

DRG methods typically include outlier provisions to pay separately for stays that are unpredictably expensive. A state can follow the Medicare model or develop its own calculation mechanism.

### 4.2.1 Purpose of Outlier Payment

Given the wide range of cases seen in the inpatient setting, the chief challenge in any inpatient payment method is to align payment with expected resource use in a way that is fair to hospitals while also providing appropriate incentives for efficiency. Resource use can be measured by charges, cost, length of stay or some other way. However it is measured, the goal is to pay more for cases with higher expected resource use and less for cases with lower expected resource use.

Variation in resource use from case to case reflects both predictable factors and unpredictable factors. Predictable factors include principal diagnosis, performance of a major procedure, age, complications, comorbidities, and discharge status. The DRG grouper is designed to capture predictable factors so that the relative weight and therefore the DRG base payment may be set accordingly.

Outlier payments are appropriate because it is not always possible for the DRG grouper to capture the idiosyncrasies of individual stays.

## 4.2.2 Cost Outlier Adjustment: High Side

### Box 4.2.2.1 Remaining Decisions before Implementation

- Set the values of the high-side cost outlier thresholds 1 and 2
- Set the values of marginal cost factors 1 and 2

Cost outlier calculations are always in two steps. First, the stay is evaluated for whether it qualifies as a cost outlier stay. If so, then the second step is to calculate the cost outlier payment.

Although there is no necessary reason for a Medicaid program to follow Medicare (and some states do not) the Medicare model is well accepted by hospitals. We suggest the following approach that is based on the Medicare model but with added references to threshold 2 and marginal cost factor 2.

(4.2.2.1) ESTMD HOSPITAL COST = COVERED CHARGES<sup>77</sup> X HOSPITAL-SPECIFIC CCR

(4.2.2.2) LOSS OR GAIN = DRG BASE PAYMENT<sup>78</sup> – ESTIMATED COST

(4.2.2.3) COST OUTLIER STAY = YES, IF  $|\text{LOSS}| > \text{COST OUTLIER THRESHOLD 1}$

(4.2.2.4) COST OUTLIER PAYMENT =

- a)  $[(|\text{LOSS}| - \text{COST OUTLIER THRESHOLD 1}) \times \text{MARGINAL COST FACTOR 1}]$ , TO A MAXIMUM OF  $[(\text{COST OUTLIER THRESHOLD 2} - \text{COST OUTLIER THRESHOLD 1}) \times \text{MARGINAL COST FACTOR 1}]$   
Plus
- b)  $[(|\text{LOSS}| - \text{COST OUTLIER THRESHOLD 2}) \times \text{MARGINAL COST FACTOR 2}]$ ; CANNOT BE NEGATIVE

The use of two cost outlier thresholds and two marginal cost factors is unusual among DRG payers and is specifically intended to buffer hospitals against extreme losses on extreme outlier cases. Table 4.2.2.1 shows examples of stays where threshold 1 is set at \$30,000, threshold 2 is set at \$100,000, marginal cost factor 1 is set at 60% and marginal cost factor 2 is set at 80%. (These values are illustrative; final values will be determined before implementation.) The effect is that for losses from \$30,000 to \$100,000, the hospital is paid 60% of the loss to a maximum of \$42,000. Once the loss hits \$100,000, then it is paid 80% for that part of the loss exceeding \$100,000.

Table 4.2.2.1

## Examples of High-Side Outlier Payment Using Two-Step Payment Calculation

Stay No.	Charges	Est. Cost	DRG Base Payment	Loss	Outlier Payment 1	Outlier Payment 2	DRG Payment	Loss	Pay to Cost
1	\$100,000	\$25,000	\$5,000	\$(20,000)	\$-	\$-	\$5,000	\$(20,000)	20%
2	\$200,000	\$50,000	\$5,000	\$(45,000)	\$9,000	\$-	\$14,000	\$(36,000)	28%
3	\$300,000	\$75,000	\$5,000	\$(70,000)	\$24,000	\$-	\$29,000	\$(46,000)	39%
4	\$400,000	\$100,000	\$5,000	\$(95,000)	\$39,000	\$-	\$44,000	\$(56,000)	44%
5	\$500,000	\$125,000	\$5,000	\$(120,000)	\$42,000	\$16,000	\$63,000	\$(62,000)	50%
6	\$600,000	\$150,000	\$5,000	\$(145,000)	\$42,000	\$36,000	\$83,000	\$(67,000)	55%
7	\$700,000	\$175,000	\$5,000	\$(170,000)	\$42,000	\$56,000	\$103,000	\$(72,000)	59%
8	\$800,000	\$200,000	\$5,000	\$(195,000)	\$42,000	\$76,000	\$123,000	\$(77,000)	62%
9	\$900,000	\$225,000	\$5,000	\$(220,000)	\$42,000	\$96,000	\$143,000	\$(82,000)	64%
10	\$1,000,000	\$250,000	\$5,000	\$(245,000)	\$42,000	\$116,000	\$163,000	\$(87,000)	65%

## Notes:

- 1 In these examples, the hospital-specific cost-to-charge ratio is 25%, threshold 1 is set at \$30,000, threshold 2 is set at \$100,000, marginal cost factor 1 is set at 60%, and marginal cost factor 2 is set at 80%. Actual values of the CCR will vary by hospital; final values for the thresholds and marginal cost factors will be determined before implementation.

There are a few key differences in how various payers put outlier payments into operation. These include the following:

- Cost-to-charge ratio.** We recommend use of hospital-specific CCRs rather than a single statewide CCR, even though the single statewide CCR would be simpler. The reason is that hospitals vary considerably in how they mark up charges over cost, so use of hospital-specific data is more fair to hospitals. In situations where a hospital-specific CCR is not available (e.g., an out-of-state hospital or a new hospital), then a default statewide CCR would be used. The default CCR would affect only a small number of stays.<sup>79</sup> One source would be the most recent Medicare urban CCR for California, including operating and capital components.
- Cost outlier threshold.** We recommend use of a single cost outlier threshold value rather than thresholds that vary by DRG. Where DRG-specific thresholds are used (e.g., Montana and South Carolina) the effect is that hospitals sustain higher losses on higher-paying DRGs before cost outlier payments kick in. For California, we think that following Medicare in its use of a single threshold is more consistent with the purpose of outlier payments as described in Section 4.2.1. The essential justification is that a hospital is only at full risk for cost up to the point where its loss is, say, \$30,000, and after that point the payer shares in the loss. The policy is the same regardless of the patient condition.
- Marginal cost factor.** Once the payer does share in the hospital's loss, it covers less than 100 percent of the loss above the threshold. Medicare's share is 80 percent (90 percent for burns) and states range from 50 percent to 80 percent. The share is called the "marginal cost factor," because it is intended to cover only the marginal costs of the additional care. These costs include only variable costs such as staffing and supplies, not fixed costs such as plant and equipment. In general, variable costs represent substantially less than 100 percent of hospital total cost.<sup>80</sup> As described above, the proposed CA-MMIS functionality would enable two levels for the marginal cost factor, e.g., 60% for the first part of the loss and 80% for the remainder of the loss.

- **Cost outlier payment pool.** For any given set of claims, the total payout for cost outliers depends on three variables: cost outlier threshold, the marginal cost factor, and the percentage of total payments that is set aside to fund outlier payments. A payer can choose to specify two of the three variables as a matter of policy. A typical decision is to set aside 5 percent of all payments as cost outlier payments, then choose a marginal cost factor. The cost outlier threshold then follows from the arithmetic. The size of the cost outlier pool can also be specified after an initial payment simulation has been performed. Medicare aims for 5 percent while Medicaid programs typically use a range of 5 percent to 10 percent.

Regardless of the outlier policy decisions made, it is essential to update the threshold value annually. Otherwise, more and more stays qualify for outlier payments, thereby undermining the incentives of a DRG payment method to reward efficiency. The Office of Inspector General has criticized states for not updating these thresholds and plans further such initiatives.<sup>81</sup> States should also monitor patterns of outlier payment. See Section 6.6.

### 4.2.3 Cost Outlier Adjustment: Low Side

#### **Box 4.2.3.1 Remaining Decision before Implementation**

Set the value of the low-side cost outlier threshold (expected to be the same as high-side threshold 1)

Just as outlier payments are intended to increase payment when a stay is extraordinarily and unpredictably expensive, various payment policy options exist to decrease funding when a stay is extraordinarily and unpredictably inexpensive.

Although cost outlier payments are standard practice among payers for extraordinarily expensive cases, there is no similar standard practice for extraordinarily inexpensive cases. Medicare, for example, pays the full DRG payment even for short stays, subject to post-payment review of the medical necessity of the admission. (Transfers are a different situation; see Section 4.1) One reason is that unusually inexpensive stays are less common than unusually expensive stays. (A frequency distribution of inpatient stays by hospital cost usually shows skewness on the right-hand side.)

Nevertheless, there can be good reasons for reducing payment when the hospital's costs are unusually low. One reason is simple public relations: questions sometimes arise why a payer is paying more than the hospital charged. The answer, of course, is that the philosophy of DRGs is to set a "price for a product" regardless of charges or costs for particular hospitals or particular stays. That explanation, however, can get lost in translation. Another reason is that reducing payment for extraordinarily inexpensive stays enables higher payment for the vast majority of stays that are paid on a straight DRG calculation.

Under APR-DRGs, some type of "low-side" outlier adjustment can also be more appropriate than under Medicare DRGs. As a more sophisticated grouper, APR-DRGs do a better job capturing the extreme costs of patients who are extremely ill. Base payments for transplant and neonatal DRGs can exceed the highest-paying MS-DRG under Medicare (\$136,721 for FFY 2012). If a patient in one of these APR-DRGs dies or for

some other reason is relatively low-cost for the hospital, then the straight base payment can seem inappropriately high.<sup>82</sup>

(4.2.3.1) COST OUTLIER STAY = YES IF GAIN > FIXED LOSS THRESHOLD

(4.2.3.2) COST OUTLIER PAYMENT = (ESTIMATED GAIN – COST OUTLIER THRESHOLD 1)  
X MARGINAL COST FACTOR 1

The low-side outlier logic would be symmetric to the high-side outlier logic, except that only threshold 1 and marginal cost factor 1 would be used. If we take \$30,000 as an example (only) of an outlier threshold value, then the high-side outlier policy is that a hospital can lose a maximum of \$30,000 on a particular stay before Medicaid shares in its loss by increasing payment. The low-side outlier policy is that a hospital can gain a maximum of \$30,000 on a particular stay before Medicaid shares in its gain by decreasing payment.

## 4.3 Add-on Payments Functionality

Add-on payments are unrelated to DRG pricing. Typically these payments are hospital-specific, while DRG payments are typically the same for all hospitals for any given DRG. Examples of add-on payments used by some payers include cost-based payment for capital, cost-based payment for medical education, some “DSH” payments to disproportionate share hospitals, and bonuses under pay-for-performance programs.

We recommend that the payment method include provisions for a hospital-specific add-on payment to be added for each stay. In California, supplemental payments have traditionally been made outside the claim payment system. See Section 4.6. Nevertheless, we recommend creation of the functionality in order to enable future policy flexibility. The functionality would be for the CA-MMIS pricing logic to look up the provider file and apply the inpatient add-on field value to each inpatient claim.

## 4.4 Partial Eligibility

In some cases, the fee-for-service Medi-Cal program is financially responsible for fewer days than the entire length of stay. During the stay, the beneficiary either gains or loses Medi-Cal eligibility or moves between fee-for-service Medicaid and Medicaid managed care. Eligibility is for the entire month, so in practice these situations tend to arise when an inpatient stay crosses two or more months. Specific examples include:

- **Gain of Medi-Cal eligibility.** A patient is in the hospital for 10 days and gains Medi-Cal eligibility on day three.
- **Loss of Medi-Cal eligibility.** A patient is in the hospital for 10 days and loses Medi-Cal eligibility on day five. This is likely a rare situation as most beneficiaries would keep eligibility for the entire hospitalization.
- **FFS and managed care eligibility within the same stay.** Some children enrolled in a Medi-Cal managed care plan have a medical condition that is covered by California Children’s Services on a fee-for-service basis.<sup>83</sup> The managed care plan pays for hospital care unrelated to the CCS condition while fee-for-service Medi-Cal pays for care related to the CCS condition.

We do not recommend any change to how CA-MMIS interfaces with the eligibility system.

In terms of payment, an advantage of the previous payment method was that it fit well with situations where specific days of care were not covered. For contracted hospitals paid per diem, no payment was made for non-covered days. For non-contracted hospitals paid on an interim basis at a percentage of charges, no payment was made for charges levied for non-covered days.

Under DRG payment, where payment is made per stay regardless of the number of days or the volume of charges, the situation is more complex. From a policy perspective, the payer's goal is to not pay for non-covered days.

Our recommended method of putting this policy into operation is to compare the covered days with the average length of stay for the particular DRG. If the covered days equal or exceed the ALOS, then the hospital receives full payment for the stay. If the covered days are less than the ALOS, then the DRG payment (including the transfer adjustment, and outlier payments, if applicable) is divided by the ALOS to yield a per diem amount that is multiplied by the number of covered days to generate the payment amount. See Section 6.2 for DRG Calculator examples, including how this payment adjustment would interact with other payment policies.

$$(4.4.1) \text{ BASE PAYMENT ADJUSTED FOR PARTIAL ELIGIBILITY}^{84} = \frac{(\text{DRG BASE PAYMENT})}{(\text{ALOS})} \times (\text{LENGTH OF STAY})$$

This calculation is similar to that used for transfer adjustments and would be consistent with the philosophy underlying DRG payment, that is, to pay a price for a "product" delivered by the hospital. If the "product" is at least as many days of care as is typical for that DRG, then the hospital receives the full price even though the stay included days of care when the patient was not eligible.<sup>85</sup>

In situations of partial eligibility, the hospital would be instructed to bill Medi-Cal with at least one of the following occurrence codes. Presence of either code would trigger the partial eligibility adjustment as described in the previous paragraph.

- A2 Effective date of insurance policy
- A3 Benefits exhausted

UB-04 billing instructions also include provision for the date to be shown in the occurrence code field. In CA-MMIS claims pricing, however, only the A2 or A3 value would be relevant.

After DRG implementation, appropriate use of the A2 and A3 values would have to be monitored. The reason is that a short stay without an A2 or A3 value would be paid at the full DRG-based amount. See Section 6.6.

Another billing implication would be that the presence of occurrence code A3 would enable the claim to bypass the edit that will deny interim claims that are less than the interim claim threshold (See Section 5.2.2). The reason is that if a patient loses eligibility during a stay then it would be appropriate for the hospital to submit a discharge status of 30 (still a patient) and bill types of 112 or 113 (interim claim, initial or continuing).

We note that partial eligibility differs from two other adjustments to payment.

- **Transfer adjustment.** When a patient is transferred between acute care hospitals, the transfer adjustment may be applicable. An example would occur when a newborn initially covered by a Medi-Cal managed care plan is transferred to another hospital for coverage of a CCS condition. See Section 4.1.1.
- **Share of cost.** When the patient has to “spend down” to Medi-Cal eligibility or is otherwise responsible for a share of cost (SOC), the SOC will be deducted from the allowed amount in calculating the reimbursement amount, as was true under the previous payment method. See Section 4.5.

## 4.5 Other Health Coverage and Share of Cost

In general, Medicaid programs calculate the allowed amount for a service and then subtract three dollar quantities in determining the reimbursement amount, that is, the actual payment to the provider. The three quantities are:

- **Other health coverage (OHC).**<sup>86</sup> If a commercial payer or some other third party is liable for some portion of the claim, then that portion is subtracted from the allowed amount. Medi-Cal defines other health coverage (also known as third party liability) as “any non-Medi-Cal private health coverage plan or policy that provides or pays for health care services.” A Medi-Cal beneficiary is considered to have OHC when the individual receives health care benefits from organizations such as commercial health insurance companies, prepaid health plans, health maintenance organizations, and other benefit plans.
- **Share of cost (SOC).**<sup>87</sup> Some Medi-Cal beneficiaries must pay, or agree to pay, a monthly dollar amount toward their medical expenses before they qualify for Medi-Cal benefits. This dollar amount is called share of cost. A beneficiary’s SOC is similar to a private insurance plan’s out-of-pocket deductible. Some services are exempted from the SOC provisions, including pregnancy and post-partum related services. Medi-Cal instructs providers to identify SOC on the UB-04 using the value code and amount fields. The Share of Cost or SOC amount is subtracted from the allowed amount in calculating payment to the provider.
- **Other cost-sharing.** Other cost-sharing comprises copayments and coinsurance, neither of which is applicable for Medi-Cal inpatient care.<sup>88</sup>

Because this policy design document addresses the determination of the allowed amount, no changes are anticipated to the MMIS logic that calculates the difference between the allowed and the reimbursement amounts. We recommend that other health care coverage payments and share-of-cost continue to be applied under the DRG payment method as was previously done.

## 4.6 Supplemental Payments

California provides supplemental payments to eligible hospitals under various programs. These payments are typically not tied to any particular claims. Examples of supplemental payments include disproportionate share hospital (DSH) payments and payments for medical education. Supplemental payments are outside the scope of the DRG payment method.

## 4.7 Separately Payable Services, Supplies and Devices

### Box 4.7.1.1 Remaining Decisions before Implementation

Make policy decision about which specific services, supplies and devices would be separately payable, with which CPT/HCPCS codes, and at what payment rates.

In general, DRG payment is intended to cover all services and supplies provided during an inpatient stay. Hospitals therefore have strong incentives to manage both the quantity and the prices of the services, supplies and devices they use. In principle, the DRG relative weights reflect the average costs of devices and supplies that are needed to, e.g., implant a defibrillator or repair a hip fracture. In practice, DRG payment works well enough that exceptions are rare. We refer to these exceptions as separately payable services, supplies and devices.

Medicare currently allows separate payment for inpatient services under three circumstances.<sup>89</sup>

- **Organ acquisition.** In most cases, these costs are reimbursed through the cost settlement process; for renal transplants, designated renal transplantation hospitals are paid adjusted rates.
- **Blood clotting factors.** Blood factors are paid based on a fee schedule (e.g., 95% of average wholesale price).
- **New medical technology.** Devices that meet very specific Medicare criteria related to newness, FDA approval, substantial clinical improvement and unusual costliness criteria may qualify for add-on payments. Very few devices meet these criteria.

Under the Medi-Cal Selective Provider Contracting Program, the California Medical Assistance Commission also allowed separate payment in specific circumstances, chiefly organ acquisition, blood clotting factors and dialysis. (See Table 2.4.2.1 in the *Summary of the Analytical Dataset*, December 2011) These payments were made in the context of a payment method in which each hospital received the same flat-rate per diem payment amount for all or almost days of care, regardless of cost.

Other DRG payers often do not allow separately payable devices and supplies, because of both the concern over incentives and the added complexity to the payment method.

In designing the new DRG-based payment method, once again we face a trade-off among the principles listed in Section 1.3. Allowing separate payment for specific services, supplies or devices diminishes the incentives for efficiency, reduces transparency, increases administrative burden, and increases complexity. On the other hand, that access to care may be jeopardized if a certain type of case will be a predictable money-loser even with the casemix and outlier adjustments of a DRG payment method. An example is surgery for patients with hemophilia. The need for blood factors can sharply increase the hospital's cost of an otherwise routine surgery.

Our recommendation is that CA-MMIS functionality should enable separate payment for a very short list of specific services, supplies and devices. Existing CA-MMIS functionality could be used; it allows separate payment on an outpatient claim for certain services, supplies and devices even though the patient has been admitted for inpatient care. The current logic applies to specific HCPCS codes at specific hospitals; in the future it would apply to specific HCPCS codes regardless of the treating hospital.

The specific list of separately payable services, supplies and devices need not be finalized before this policy design document is approved. Subject to further analysis and discussion, our current view is that blood factors and bone marrow search and acquisition costs would be appropriately included on the list. The necessity and cost of blood factors varies considerably and unpredictably from stay to stay, even for the same patient. For these reasons, Medicare pays separately for blood factors. Bone marrow search are typically billed as outpatient services; these costs also vary widely and unpredictably. Bone marrow acquisitions are closely related to the search costs.

Although Medicare does pay separately for organ acquisition costs on a cost reimbursement basis, we do not believe the extra complexity is justified in this case. The reason is that payment simulations show significantly increased payments for organ transplants, from 67% of hospital cost under the previous payment method to 89% of cost under DRG payment. This increase is an example of how casemix-adjusted DRG payment methods can enable access to care for the sickest patients. As with all other aspects of the payment method, the list of separately payable services, supplies and devices can be revisited later on with the benefit of experience.

In simulations performed to date, financial data for all services, supplies and devices that had been separately payable under the previous payment method were rolled into the corresponding inpatient claims. The impact was only to add 0.30 percent, or \$10.5 million, to baseline payment in the 2009 analytical dataset. However, these services tended to be concentrated in specific DRGs.<sup>90</sup> In setting the final DRG base prices and other payment method parameters, we will adjust the analytical dataset so that it reflects the Department's final decisions on the list. Blood factors and other items that may be on "separately payable" list will be removed from the baseline, so that the end result is an "apples vs apples" comparison of baseline payment with DRG payment, including outlier payments as appropriate.

## 4.8 Newborn Hearing Screening

The California Newborn Hearing Screening Program was established by law to identify newborns and infants with a hearing loss prior to three months of age and to implement audiological and early intervention services by six months of age.<sup>91</sup> Hospitals with perinatal services are required to provide inpatient hearing screening for all newborns with the parent's permission, prior to hospital discharge. Medi-Cal payment for newborn hearing screenings is an all-inclusive flat fee billed as an outpatient service, separate from the inpatient hospital stay.<sup>92</sup>

Implementation of DRG payment would have no effect on this screening program.

## 4.9 Negotiated Payments

In exceptional circumstances, there may be a need to negotiate a specific payment level for hospital inpatient services provided to Medicaid beneficiaries by out-of-state hospitals. For example, payment for cases involving specialty care such as pediatric organ transplants is sometimes negotiated separately since only a few hospitals nationwide can provide this care. The intention is that such arrangements would be truly exceptional, applying to perhaps a half-dozen cases per year. The risk from a payment policy perspective is that creating this flexibility would create an expectation that negotiated payment would become the norm for certain types of cases.

For the design of the new payment method we recommend incorporating functionality that will give the Department the flexibility to negotiate payment to an out-of-state hospital in extremely rare situations where complex medical services and surgical procedures otherwise would be unavailable. This flexibility would not be available to California hospitals, which serve sufficient volumes of Medi-Cal patients that payment adequacy would be more appropriately viewed across all stays. We also recommend that enabling language be included in the DRG state plan amendment.

DRG-based payments will reduce the need for negotiated payments and will help DHCS in negotiations when they do occur. The APR-DRG algorithm covers all inpatient medical conditions and procedures that can be classified using the ICD coding scheme, which itself is intended to be exhaustive. Therefore even claims with rare conditions and procedures will group to an APR-DRG. DRG payment will be much more accurate than the previous per diem payment in paying more for more costly cases. Indeed, Medi-Cal's regular DRG-based payment may be sufficient for some stays where the treating hospital previously insisted on negotiated payment. When negotiations are needed, the starting point can be Medi-Cal's payment for that APR-DRG. California could also compare its rate with what would be paid by New York, Texas, South Carolina, Montana, Rhode Island and other states that use APR-DRGs.

## 4.10 Pay for Quality (P4Q)

Payers are increasingly interested in incorporating quality measurement and P4Q incentives in their payment methods. Any such initiatives require careful study and implementation.

### 4.10.1 Health Care-Acquired Conditions (HCACs)

The Patient Protection and Affordable Care Act (PPACA) prohibited federal payments to states for Medicaid services related to health care-acquired conditions or HCACs.<sup>93</sup> The PPACA required the federal government to issue regulations effective July 1, 2011, that would apply to Medicaid.

On June 1, 2011, CMS published final regulations on the health care-acquired conditions requirements for state Medicaid agencies. While the rule became effective July 1, 2011, CMS announced a delay in compliance action until July 1, 2012, in order to allow states additional time for implementation and provider involvement.

In general, the Medicaid HCAC rule provides flexibility to states to identify the conditions and the service settings that would be subject to adjustment in payment or non-payment policies. At the same time, California and other states must comply with the minimum requirements established by the PPACA and federal regulations. This section discusses the Medicaid HCAC minimum requirements and makes recommendations for compliance as applicable to the hospitals within the scope of the DRG payment method.

#### **Federal Requirements: Medicare**

The Medicaid HCAC minimum requirements are based on similar provisions in Medicare's "Hospital-Acquired Conditions and Present on Admission Indicator Reporting (HAC & POA)" payment policy.

Under the Medicare HAC & POA policy, CMS is required to apply a quality adjustment to the Medicare DRG for certain hospital-acquired conditions or HACs. Medicare implemented the program in two phases: first by requiring hospitals to report the POA indicator effective October 1, 2007, and then by implementing payment reductions for a specified list of HACs effective with discharges on or after October 1, 2008.

Under Medicare, these conditions must meet three criteria in order to be added to the HAC list, namely, the condition must be (a) high cost, high volume or both; (b) result in the assignment of a case to a DRG that has a higher payment when present as a secondary diagnosis; and (c) could reasonably have been prevented through the application of evidence-based guidelines.

The HAC & POA payment policy is triggered when the condition is on the HAC list, it is a secondary diagnosis and the condition was acquired during the stay, that is, the patient did not have the condition when admitted to the hospital (captured through specified present-on-admission indicator values on the claim). If these criteria are met then the diagnosis will not be considered in DRG assignment, with the effect that the HAC would not increase the DRG assignment or the payment to the hospital.

The Medicare HAC & POA payment provision applies to hospitals subject to Medicare's Inpatient Prospective Payment System (IPPS).<sup>94</sup> Complete documentation by hospitals of diagnoses, procedures and POA indicators is critical to meaningful data.

By Medicare's definition, a HAC "could reasonably have been prevented through the application of evidence-based guidelines."<sup>95</sup> In other words, the presence of a HAC during the stay reflects a failure by the hospital. CMS therefore drew the HAC list very narrowly so that the payment reduction would be clearly defensible in all or almost all cases.

In practice, there are hardly any HACs. For FY 2010, Medicare reported that only 0.16 percent of over 10.2 million stays included a HAC.<sup>96</sup> Moreover, because payment is affected only if the HAC affected the DRG assignment, payment was reduced for only 0.04 percent of stays. The financial impact on Medicare and hospitals has been negligible.<sup>97</sup>

### **Federal Requirements: Medicaid**

Under the Medicaid HCAC regulations, states must comply with minimum requirements which include nonpayment for conditions on the Medicare list of HACs. In addition, states are also required to deny payment for services commonly referred as erroneous surgeries. (Erroneous surgeries are also identified by Medicare as part of its National Coverage Determination policies.)

Other requirements for state Medicaid programs include items such as:

- Ongoing state compliance with the HCAC conditions based on Medicare's final annual hospital IPPS rule, which is published in August of each year
- Requiring provider reporting to ensure that the conditions are identified in claims for Medicaid payment
- Applying the Medicaid HCAC minimum requirements to conditions occurring in any inpatient hospital setting
- Submitting a state plan amendment on compliance with the Medicaid HCAC requirements
- Ensuring that payment is reduced for HCACs when payment is made on a per diem basis
- Reduced payment is limited to the amounts directly identifiable as related to the HCAC and the resulting treatment
- Extending the requirements to all Medicaid contracts and subcontracts
- Extending the requirements to Medicaid managed care contracts
- Ensuring nonpayment of these conditions for Medicare crossover claims where a Medicare HAC denial occurs
- Compliance with CMS reporting requirements

## Analysis of Medi-Cal Claims

In order to estimate the impact of Medicaid HCAC regulations on fee-for-service Medi-Cal, we analyzed 286,338 stays from CY 2009. These stays were from the simulation baseline dataset and included present-on-admission values. The data subset excluded stays that were modeled as transitioning to managed care by 2013, stays where a newborn claim was derived from the mother's claim, and stays where a CA-MMIS claim record could not be matched to an OSHPD record. (The OSHPD records were the source of the POA values in the simulation baseline dataset.) See Section 2.2 of the *Summary of Analytical Dataset* for details.

Table 4.10.1.1 shows the number of occurrences for each POA valid value. As expected, "Y" (present on admission) was the most frequent occurrence, that is, the HCAC condition would have no impact on payment since it was not acquired during the stay. There were few occurrences of invalid or missing POA values.

Under the new payment method, CA-MMIS will need to capture the POA indicator and edit the values submitted on the claim in order to appropriately adjust payment in the presence of an HCAC condition.

**Table 4.10.1.1**  
Prevalence of Present-on-admission (POA) Indicators

POA Ind	Description	Occurrences	Percent of Total	Payment Impact
Y	Diagnosis was present at time of inpatient admission	1,833,563	73.8%	Payment made for condition when an HCAC is present
N	Diagnosis was not present at time of inpatient admission	201,490	8.1%	No payment made for condition when an HCAC is present on a secondary diagnosis
U	Documentation insufficient to determine if condition was present at the time of inpatient admission	2,266	0.1%	No payment made for condition when an HCAC is present on a secondary diagnosis
W	Clinically undetermined. Provider unable to clinically determine whether the condition was present at the time of inpatient admission	2,043	0.1%	Payment made for condition when an HCAC is present
Blank	Unreported/not used. Diagnosis is exempt from POA reporting	444,928	17.9%	Payment made for condition when an HCAC is present
Invalid	Invalid / Missing	159	0.0%	
<b>Total diagnosis values</b>		<b>2,484,449</b>	<b>100%</b>	

**Notes:**

- 1 CMS established a value code of "1" for POA as a workaround to 'blank' reporting on the electronic 4010A1. However, in the dataset used for this analysis a "1" is not captured. 5010 specifications provide more specific direction in the future.
- 2 A list of exempt ICD-9-CM diagnosis codes is available in the ICD-9-CM Official Guidelines for Coding and Reporting at [www.cdc.gov/nchs/data/icd9](http://www.cdc.gov/nchs/data/icd9).
- 3 Only stays in the simulation dataset supplemented with OSHPD diagnosis, POA, and procedure codes were used for the HAC analysis.

To improve our understanding of the HCAC requirements for California, we used the Medicare list of HACs, the POA data from the analytical dataset, and the version 29 APR-DRG algorithm to group the stays with and without the HAC.

The Medicaid HCAC list is almost identical to the Medicare HAC list, except in the case of the category of deep vein thrombosis or pulmonary embolism after certain orthopedic procedures. For Medicaid, this category does not apply to total knee replacement and total hip replacement for pediatric and obstetric populations. For our analysis, we used the Medicare HAC list, which does not make this distinction.

As with the Medicare HAC list, the list of conditions for Medicaid has been narrowly drawn. Table 4.10.1.2 shows the list of Medicaid HCACs and payment analysis for CY 2009 for Medi-Cal hospitals, including designated public hospitals (DPHs).<sup>98</sup> The first section of the table shows the HAC analysis results for DRG hospitals (hospitals to be paid by DRG); and the second section shows the results for DPHs (hospitals paid outside the DRG payment method).

Table 4.10.1.2 shows that out of the 373,131 stays, there were just 485 stays statewide that included a hospital-acquired condition, or 0.125 percent of all stays. In just 17 stays (0.005 percent) would the hospital-acquired condition have made a difference in the calculated DRG payment. Table 4.10.1.2 also demonstrates the effect on payment when there is a change in the DRG assignment due to the presence of a HCAC. For example, for the HAC category *Falls and Trauma*, the sum of the DRG relative weights decrease from 94 to 86, after removing the HACs just for these stays.

Table 4.10.1.2 shows similar prevalence of the HAC conditions between designated public hospitals and hospitals that will be subject to the DRG. DRG hospitals and DPHs contribute proportionately to the prevalence of the top four conditions (vascular catheter-associated infections, catheter urinary tract infections, pressure ulcers, and falls/trauma) as well as in the number of stays with a change in the DRG assignment.

For DRG hospitals, the analysis shows that out of the 286,338 stays, there were just 315 stays that included a hospital-acquired condition, or 0.11 percent of all stays. In just nine stays (0.003 percent) would the hospital-acquired condition have made a difference in the calculated DRG payment.

California's results are very consistent with the experience of Medicare and what we have seen in other states. In an analysis we did for South Carolina Medicaid, only 0.19 percent of 65,697 stays included a HAC. In our simulation of payment by APR-DRG (which South Carolina implemented in October 2011), payment would be decreased in only 0.01% of stays.<sup>99</sup> The implication is that the HCAC program, as currently applied, is unlikely to generate strong incentives to prevent adverse outcomes.

Table 4.10.1.2

## Prevalence of Health Care-Acquired Conditions in Medi-Cal Fee-for-Service, CY 2009

HCAC Category	Stays	Charges	Est Cost	Baseline Payment	APR-DRG Change		Sum of Relative Weights	
					Yes	No	Before HCAC Removal	After HCAC Removal
<b>DRG Hospitals</b>								
Vascular catheter-assoc. infection	203	\$115,175,904	\$28,181,788	\$17,244,694	-	203	1,297	1,297

Blood incompatibility	-	\$0	\$0	\$0	-	-	-	-
Surgical site infection following CABG	-	\$0	\$0	\$0	-	-	-	-
Surgical site infection after bariatric surge	-	\$0	\$0	\$0	-	-	-	-
<b>Total DPH</b>	<b>170</b>	<b>\$104,809,070</b>	<b>\$24,160,093</b>	<b>\$13,026,491</b>	<b>8</b>	<b>162</b>	<b>947</b>	<b>940</b>
<b>As a percent of 86,793 stays</b>	<b>0.20%</b>	<b>2.33%</b>	<b>2.26%</b>	<b>1.71%</b>	<b>0.01%</b>	<b>0.19%</b>		
<b>All Medi-Cal stays with a HCAC condition</b>	<b>485</b>	<b>\$266,681,581</b>	<b>\$63,101,112</b>	<b>\$37,626,947</b>	<b>17</b>	<b>468</b>	<b>2,774</b>	<b>2,756</b>
<b>As a percent of 373,131 stays</b>	<b>0.13%</b>	<b>1.65%</b>	<b>1.66%</b>	<b>1.34%</b>	<b>0.005%</b>	<b>0.125%</b>		
<i>Notes:</i>								
1 Charges, cost and payment are for the entire stay, not the HAC.								
2 Exception: DVT/PE after certain orthopedic procedures is not considered a HCAC when it involves total knee replacement and total hip replacement for Medicaid pediatric and obstetric populations. For our analysis, we used the Medicare HAC list, which does not make this distinction.								
3 List of health care-acquired conditions based on Medicaid final rule <i>Federal Register</i> 76:108 (June 6, 2011), effective 07/01/2011.								
4 Diagnoses updated based on Medicare IPPS final rule <i>Federal Register</i> 76:160 (August 18, 2011), pp. 51511-51512, effective 10/1/2011.								
5 UTI= urinary tract infection; CABG= coronary artery bypass graft; DVT= deep vein thrombosis; PE= pulmonary embolism.								

While the potential impact to Medi-Cal is negligible, there is still a federal regulatory requirement to implement a change to the inpatient hospital payment method to assure that HCACs do not increase payment to hospitals.

The first step is to begin collecting the present-on-admission indicators. Hospitals are accustomed to reporting this information to Medicare, so this should not present a hardship. The MMIS must be modified to capture the POA indicators related to all diagnosis and procedure codes submitted on the claim.

We recommend implementation of the 3M™ Hospital-acquired Condition (HAC) Utility supplied with the APR-DRG grouper.<sup>100</sup> The HAC utility supports the Medicaid list of HCACs. This utility will identify and remove HCAC diagnoses and/or procedure codes from claims that are identified as health care-acquired conditions developed during a hospital stay (POA indicator value of N or U - Not present or Unable to determine).

In addition, Medi-Cal identified exception criteria for four HCAC categories when the beneficiary is less than 21 years of age, namely, air embolism, catheter-associated urinary tract infection, vascular-catheter associated infection and surgical site infection (mediastinitis, following pediatric cardiac surgery). DHCS will determine whether an exception is warranted based on clinical review of each case. To accommodate this process, we recommend allowing these claims to be priced ignoring the presence of the HCAC. When a claim is found to have a HCAC in one of these four categories and the beneficiary is under the age of 21, the claim will pay in full and post payment review will be performed to determine if the HCAC warrants payment reduction. A new field to capture HCAC category will need to be added at the claim header level and a new system list will need to be added to CA-MMIS to list these exceptional HCAC categories.

## Erroneous Surgeries

In addition to the Medicaid HCAC list, the Medicaid HCAC regulations also require states to adopt the Medicare nonpayment policy regarding three erroneous surgeries. In January 2009, Medicare issued three National Coverage Determination (NCD) memoranda on the coverage of erroneous surgeries on Medicare patients. Essentially, Medicare does not cover the procedure when the practitioner erroneously performs: 1) the wrong procedure altogether; 2) the correct procedure but on the wrong body part; or 3) the correct procedure but on the wrong patient.<sup>101</sup> Medicare's coverage provisions include:<sup>102</sup>

- Hospitalizations and other services related to these non-covered procedures are not covered, including services in the operating room and providers who could bill for operating room services.
- A provider cannot shift financial liability for the non-covered services to the beneficiary, primarily because the beneficiary's consent would not have met the required criteria under Medicare for a valid consent.
- The policy applies to hospital inpatient claims, practitioner, ambulatory surgical centers, hospital outpatient, and other appropriate types of bill.

Table 4.10.1.3 provides coding information to identify claims with the three erroneous surgeries. For the list of erroneous surgeries, there were zero incidences in the CY 2009 analytical dataset. To address this federal requirement, we recommend a general approach similar to Medicare with some modifications as follows:

1. In the existing CA-MMIS diagnosis table, set diagnosis codes E8765, E8766, and E8767 to suspend to the fiscal intermediary for manual review since they represent the minimum requirement under the rule. If it is determined that the wrong surgery was performed, no payment should be made for these services and services directly related to the wrong surgery.
2. Depending on the results of the quality review, payment for all or part of the claim could be disallowed for the inpatient claim and any other related claims.

Table 4.10.1.3

Never Events or Erroneous Surgeries - Affected Claims

Erroneous Surgery	ICD-9-CM Diagnosis E-codes	UB-04 & X12N 837I	CMS1500 & X12 837P	Crossovers (Professional/ Institutional)	Payment Impact
Surgery – wrong body part	E876.5 - Performance of wrong operation (procedure) on correct patient	Y	Y	Y	No payment for the procedure and related services
Surgery – wrong patient	E876.6 - Performance of operation (procedure) on patient not scheduled for surgery	Y	Y	Y	No payment for the procedure and related services
Surgery – wrong procedure	E876.7 - Performance of correct operation (procedure) on wrong side/body part	Y	Y	Y	No payment for the procedure and related services
Erroneous Surgery	CPT/HCPCS Modifiers				
Surgery – wrong body part	PA - Surgical or other invasive procedure on wrong body part		Y	Y	No payment for the procedure and related services
Surgery – wrong patient	PB - Surgical or other invasive procedure on wrong patient		Y	Y	No payment for the procedure and related services
Surgery – wrong procedure	PC - Wrong surgery or other invasive procedure on patient		Y	Y	No payment for the procedure and related services

Notes:

- 1 CMS Manual System Pub 100-04 Medicare Claims Processing, Transmittal 1819, September 29, 2009.
- 2 E-codes are not valid principal diagnosis code (FL67). May be reported in FL 67A-Q, however Ingenix UB-04 Editor states e-codes are to be reported in FL72a-c. If reported in FL67A-Q must have POA.
- 3 The simulation baseline dataset included no claims where an erroneous surgery diagnosis code was reported.

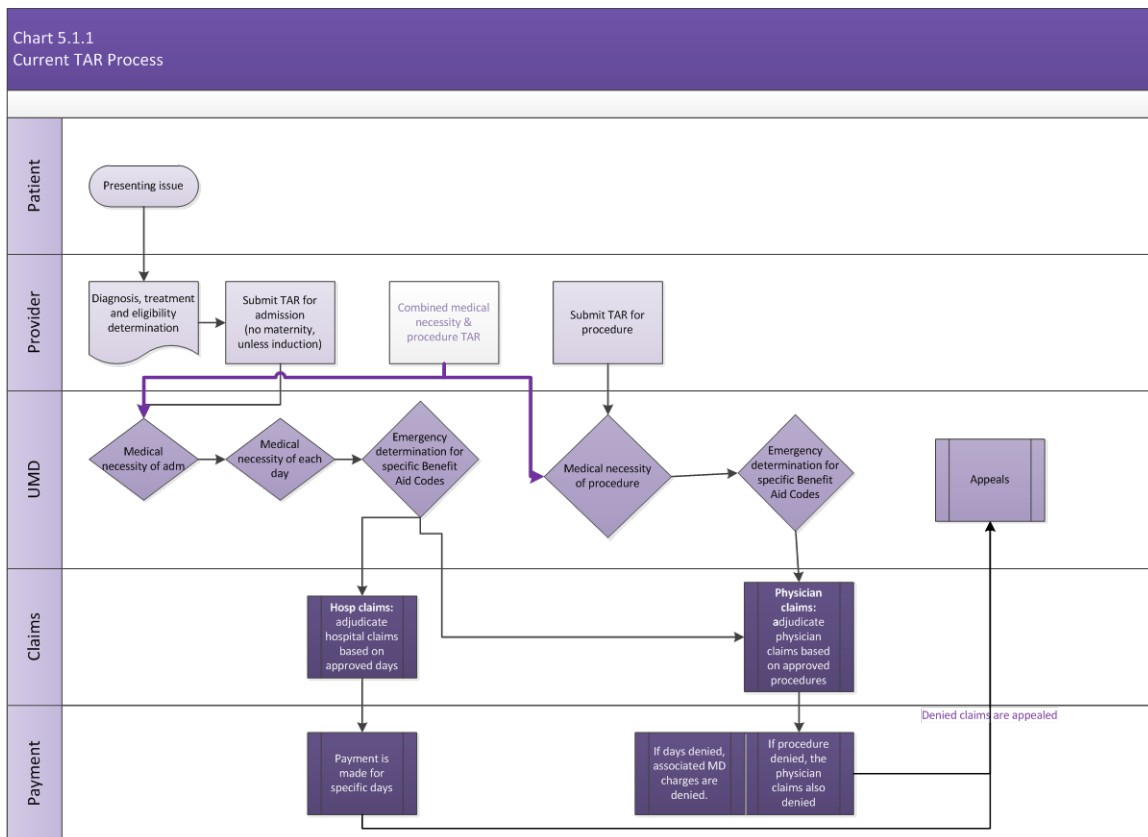

## 4.10.2 Other Quality Measures

At this time, there are no firm plans to go beyond the HCAC program in measuring and potentially adjusting payment for other quality measures. More sophisticated measures, such as measurement of potentially preventable readmissions and complications, typically require casemix adjustment in order to be fair to hospitals. The use of APR-DRGs by Medi-Cal is consistent with what has been done in other states such as New York, Maryland, Florida, Utah and Texas.

# 5 Treatment Authorization, Coding and Billing

## 5.1 Treatment Authorization Request (TAR)

Incentives to improve the efficiency of hospital admissions are inherent to DRG payment methods. Under the current payment method, almost all inpatient days (except normal newborns, two days of a vaginal delivery stay and four days of a cesarean delivery stay) are subject to approval of the inpatient day through the TAR process. In addition, specific procedures are subject to the procedure TAR and administrative days are subject to the daily TAR. See Chart 5.1.1 for a diagram of the current TAR process.

The inherent incentives to promote efficiency under DRG payment will allow a substantive decrease in the inpatient TAR process. Table 5.1.2 shows our estimate that approximately 1.1 million days would require TAR in 2013 under the current payment method. Under DRG payment, where hospitals themselves have the incentive to monitor the medical necessity of each day of care, we expect TAR to be required on only about 120,000 days, a reduction of about 950,000 days.<sup>103</sup> Table 5.1.1 summarizes the changes to the TAR process under DRG payment. Changes in the TAR process that result in a reduction of effort are highlighted in the “Recommended” column.

In the “Other” category of Table 5.1.1, each hospital day will continue to be reviewed for administrative days (Levels 1 and 2), hospice days, and non-obstetric (emergency) admissions for restricted aid codes. Each of these has specific reasons why a daily authorization is warranted. For example, administrative days do not apply under a DRG method since the person has no medical necessity for continued acute inpatient care. (Providers will be required to submit administrative days on claims separate from acute-care days.) For restricted aid codes, hospitalizations and procedures need to meet emergency criteria which cannot be evaluated through a DRG payment method or by simply looking at the medical necessity for the admission. Therefore, a daily review is necessary to determine when a hospital stay is no longer related to an emergency condition and to determine if specific procedures do not meet emergency criteria.

Reviews for medical and surgical procedures for all aid codes will continue for the identified list of procedures.

Under a DRG payment method, monitoring the risk of early discharge and inappropriate readmission is critical. Therefore, an enhancement to the TAR process will occur at the point of authorizing the medical necessity of the admission. See Section 6.6.

Table 5.1.1

## Summary of TAR Process Impacts and Recommendations

Type of Stay	TAR Approach Current	TAR Approach New	Paid under DRGs
<b>General Acute Care</b>			
General acute care inpatient stay – complete stay	TAR every day	<b>TAR admission only</b>	Yes
General acute care inpatient stay – interim claim	TAR every day	<b>TAR admission only</b>	No, paid per diem (until final claim is submitted)
<b>Obstetrics (OB)</b>			
OB admission	No TAR required	No TAR required	Yes
OB with induction day before delivery	TAR every day	<b>No TAR required</b>	Yes
OB prolonged stays- vaginal 2 days; c-sect 4 days	TAR every day	<b>No TAR required</b>	Yes
<b>Other<sup>104</sup></b>			
Designated Public Hospitals	Separate process	Continue separate process	No
Administrative day level 1	TAR every day	TAR every day	No
Administrative day level 2 (currently referred to as subacute)	TAR every day	TAR every day	No
Beneficiaries with restricted aid codes admitted for non-OB services	TAR every day, including review to ensure all services are emergency services	No change; TAR every day, including review to ensure all services are emergency services	Yes, process modified to avoid paying for non-emergency surgeries
CCS and GHPP beneficiaries	TAR every day	<b>TAR admission only</b>	Yes
Rehabilitation stays	TAR every day	TAR every day	No
Stays at psychiatric facilities	TAR every day	TAR every day	No
Medicare crossover claims – Medicare is primary payer	No	No	Medicaid amount calculated through DRG pricing before crossover comparison pricing
Hospice care	TAR every day	TAR every day	No
<b>Notes:</b>			
1	Stays for beneficiaries covered by the CCS and the THPP programs are subject to similar process called service authorization review (SAR). We use the term TAR to refer to both TAR and SAR.		
2	Outliers will be monitored using an analytical oversight process. DHCS may decide to focus TAR review for outliers as the findings indicate.

## Notes:

- 1 Certain subacute days were paid as acute days in 2009 but will be paid as admin days Level 2 in 2013. The number of days is believed to be relatively low but an exact estimate isn't available.
- 2 TAR requirements also exist for specific procedures for all beneficiaries.
- 3 Under DRG payment we assume that non-delivery stays for clients with limited benefits will require TAR in order to check that any procedures qualify as emergencies.
- 4 Stay and day counts are slightly understated because of the omission of incomplete stays from the analytical dataset. This table also excludes days at designated public hospitals and administrative days.
- 5 For clients with limited benefits, the most common non-delivery procedures are appendectomies and cholecystectomies. See Summary of the Analytical Dataset, Table 4.4.7. The most common medical DRGs are chest pain, other pneumonia, kidney and urinary tract infections, septicemia and dissemination infections and disorders of the gallbladder.

## 5.2 Late Charges and Interim Claims

### Box 5.2.1 Inpatient Hospital Bill Types

- 110—Non-payment or zero claim
- 111—Admit-through-discharge
- 112—Interim—first claim
- 113—Interim—continuing claim
- 114—Interim—last claim
- 115—Late charges only
- 117—Replacement of prior claim

Because DRG payment is per complete stay, Medicare and other DRG payers typically do not accept claims that do not represent a complete stay. The bill types not accepted are 112, 113, and 114 for interim claims, and 115 for late charges (Box 5.2.1). Medi-Cal previously accepted these bill types. Our recommendations are as follows.

### 5.2.1 Late Charges

A recommendation to deny late charges is easily made. The problem with a late charges claim is that the Medi-Cal database then contains two paid claims with the same dates of service, thereby raising the risk of duplicate payment. Any analysis of utilization would also be confounded because the dataset has two paid claims for the same stay. When it is necessary to bill for late charges, a hospital should instead submit a claim adjustment using the existing CA-MMIS process.

### 5.2.2 Interim Claims

#### Box 5.2.2.1 Remaining Decision before Implementation

Set the value of the per diem payment amount for interim claims

Interim claims require more consideration. When payment is per diem or at a percentage of charges,<sup>105</sup> as it has been in California, a hospital can request payment as often as it chooses to submit an interim claim. Under DRG payment, there is no reason for the payer to accept interim claims in the vast majority of cases. Only if a stay is exceptionally long can an argument be made that the hospital needs cash flow before the full payment for the stay is ultimately received on a DRG basis,

If we define “exceptionally long” as more than 30 days, Chart 5.2.2.1 shows that one percent of stays would fall into this category. In 2009 the actual number was 6,707 stays; after simulating the impact of the transition to managed care now under way, the number would be 5,090. Of these 5,090 stays, 3,515 were fewer than 60 days. Nevertheless, there were 1,575 stays that extended to three, four and more months; indeed, there were two stays that were almost three years in length. Table 5.2.2.1 shows that the most common situations were sick newborns and patients on ventilators.

Notes:

- Total long stays in the simulation baseline dataset = 5,090.
- Data are the responsibility of Xerox and should not be attributed to any California state agency.

Although long stays represented just 1 percent of all stays, they were of course unusually expensive. Table 5.2.2.2 shows that they represented 18 percent of all days and 20 percent of total hospital cost. Moreover, long stays tended to be concentrated in the tertiary care hospitals that treat sick newborns, ventilator patients, and other seriously ill people. For the 25 hospitals with the highest numbers of long stays, the long stays represented 28 percent of their days and 30 percent of their cost.

Essentially, the decision whether to allow payment for interim claims is a trade-off between the following.

- Cost and complexity of MMIS changes.** Although interim claim pricing would affect only about 1 percent of claims, the cost and complexity stems from the need for the per diem pricing logic, for “duplicate check” logic that identifies situations where the hospital does not replace or void all interim claims, for additional MMIS edits, and for changes to “downstream” post-pricing functions such as reporting, remittance advices, and claim inquiry functionality used by provider relations and state staff. As with all computer systems, added complexity also increases the potential for errors, confusion and delay in implementation. An additional consideration is that the legacy CA-MMIS system will be replaced by California Health Enterprise in 2016. In the interim, the Department seeks to make as few changes as possible to the legacy system.
- Benefits of cash flow to hospitals.** Long stays tend to be most prevalent at specific hospitals, as shown in Table 5.2.2.2. For these hospitals, long stays can represent 30 percent to 40 percent or more of all payments. In practice, many of these hospitals also provide specialized services to pediatric patients, where Medi-Cal represents a substantial share of the market. It is therefore possible that delays in cash flow could jeopardize access to care.

*Notes:*

- 1 Data refer to the baseline simulation dataset.
- 2 Data are the responsibility of Xerox and should not be attributed to any California state agency.

On balance, we recommend that Medi-Cal allow payment on interim claims, though only for stays that are exceptionally lengthy. This threshold would be set at 30 days. Submission of interim claims would be voluntary on the part of the hospital, but if interim claims were submitted then the hospital would be required to submit a final admit-through-discharge claim when the patient was discharged. The process would work as follows:

1. The MMIS would accept interim claims (bill types 112 and 113) so long as the day span on the claim exceeded 30 days and the patient discharge status was 30 (still a patient)
2. These claims would be paid at a statewide per diem rate; the level would have to be set low enough to avoid an incentive for hospitals to accept the interim payment and not submit the final claim for DRG payment. For the long stays in Table 5.2.2.2, average payment per day was \$1,645, so the interim per diem amount would have to be noticeably lower than that.
3. When the patient was discharged, the hospital would adjust one of the interim claims and void the other interim claims. The adjustment claim would cover the entire stay and include all the diagnosis and procedure data necessary to group the claim by DRG and to calculate payment.
4. Bill type 114 would not be accepted, because if the patient has been discharged then the hospital should adjust or void the earlier interim claims rather than submit a final interim claim.

In response to a question about the potential impact on small community hospitals, we performed an analysis that found that 96 percent of the long stays occurred in large hospitals (4,910 out of 5,090 long stays), with a median length of stay of 52 days. Fewer than one percent of the long stays occurred in small hospitals (25 out of 5,090 long stays), with a median length of stay of 44 days for this group. When we looked at hospitals under 100 beds, our study showed that in most cases hospitals with long stays were specialty hospitals or hospitals with very few claims overall, i.e., not small community hospitals serving noticeable numbers of Medi-Cal patients. We therefore believe it is very unlikely that making interim payments only for claims exceeding 30 days would hurt access to care in small community hospitals.<sup>106</sup>

## 5.3 Related Outpatient Services

We recommend no change in the definition of which outpatient services are included within the definition of an inpatient stay.

Medi-Cal would continue to require that emergency services rendered on the same date as admission or within 24 hours prior to admission must be billed on the inpatient claim with the appropriate ancillary and revenue codes. Emergency services on the same date of admission or within 24 hours prior to admission will not be separately reimbursable.<sup>107</sup>

Other outpatient services (e.g., lab, EKG, imaging) provided before admission may be billed separately if they do not fall within the definition of emergency services.

## 5.4 Administrative Days

### Box 5.4.1 Remaining Decisions before Implementation

- Set statewide per diem rate for Level 2 administrative days
- Make TAR policy decision about criteria for approving Level 2 administrative days

Some states make payment for administrative days. Generally, administrative days are defined as the days of service provided to beneficiaries who no longer require acute hospital care, but need nursing home placement or other subacute or post-acute care that is not available at the time.

Under the previous payment method, administrative days approved through the TAR process were paid at a statewide per diem rate. In addition, separate payment was allowed for specific ancillary services. In situations where a patient did not need acute care but did need more care than an administrative day, the Department authorized payment at the acute care level because no other mechanism existed. (If a patient could be transferred to a separate subacute facility, then that was the preferred path.)

We recommend that the Department implement two levels of administrative days.

- Level 1 would be the same policy as administrative days under the previous method. Admission and each day would continue to require a TAR. Payment would be made outside the DRG method, with rates and bundling policies determined by the Department. In CA-MMIS, a claim for Level 1 administrative days would be identified through the presence on the claim of revenue code 169 (room and board, other), as was true under the previous payment method.
- Level 2 would be a new level, parallel to Level 1 except at a higher rate. The bundling policy would be the same as for Level 1 days. DHCS would set the criteria to distinguish Level 1 care from Level 2. Level 2 days would be identified through the presence on the claim of revenue code 199 (other subacute care) on the claim.<sup>108</sup>

The previous billing requirement that administrative days be billed on a separate claim would continue in effect.<sup>109</sup> These claims are billed separately from other acute care claims and revenue codes.<sup>110</sup>

In CA-MMIS claims adjudication, presence of revenue code 169 or 199 on the claim would divert the claim from the DRG pricing logic and put it into the existing pricing logic for administrative days, except that there would be both Level 1 and Level 2 per diem rates. See the pricing flow chart in Section 7.13.

Going forward, the Department may want to consider an all-inclusive rate for both levels of administrative days, that is, with no separately payable ancillary services. Such a policy would improve simplicity and incentives for efficiency; analysis would be needed to ensure that bundled per diem rates would not materially jeopardize access to care.

## 5.5 Rehabilitation Stays

### Box 5.5.1 Remaining Decision before Implementation

Set statewide per diem payment rate for rehabilitation days

Rehabilitation is typically a special topic in the design of a DRG payment method for any Medicaid program. The nature of rehabilitation makes it closer to post-acute care than to acute care. As well, Medicare uses a separate payment method for rehabilitation stays, regardless of whether the care is provided by a specialty rehabilitation facility or a general hospital. For Medicaid programs, a separate payment method is usually impractical because of the small volume of Medicaid rehabilitation stays.

“Rehabilitation” is also open to alternative operational definitions, for example by treating facility, APR-DRG, principal diagnosis, procedure code, or revenue code. Table 5.5.1 shows a summary of rehabilitation care using a broad definition. For 2009, the simulation baseline dataset includes 1,240 Medi-Cal fee-for-service rehabilitation stays, representing 0.3 percent of all stays. Medi-Cal payments were \$38.1 million, representing 1.4 percent of total payments.

Given the small volume (and Medicaid's typically small role in the market for rehabilitation care) we recommend a simple payment method as follows:

- **Definition of rehabilitation.** In keeping with past CA-MMIS practice, a "rehabilitation" stay would be identified by the presence of an accommodation revenue code for rehabilitation (e.g., 118, 128, 138, 148, and/or 158). Note that this definition covers claims from both specialty facilities and general hospitals. Claims showing revenue codes for both rehabilitation and non-rehab accommodation would be denied. If a stay included both acute care and rehabilitation care, the hospital would submit two claims, one for acute care to be paid by DRG and the other for rehabilitation care to be paid per diem.
- **Treatment authorization.** All admissions for rehabilitation and all rehabilitation days would require treatment authorization, as was true under the previous payment method. DHCS may choose to authorize only rehabilitation care only at facilities with licensed rehabilitation beds.
- **Per diem payment.** Payment would be per diem, as it was under the previous payment method. In the interest of simplicity, a single statewide rate would be used. All services would be bundled within the single rate.
- **Determination of the per diem rate.** This rate would be set by DHCS. Using 2009 data for purposes of illustration, a per diem rate of \$1,211 would represent no change in payment, with an estimated pay-to-cost ratio of 117 percent (Table 5.5.1). If the pay-to-cost ratio were set at the overall state average of approximately 77 percent, then the per diem rate would be \$932. There are other possible ways to derive a per diem payment amount, including reference to rates paid by Medicare and other payers. Medicare pays for inpatient rehabilitation facility (IRF) services based on a prospective payment system where beneficiaries are assigned to intensive rehabilitation case-mix groups (CMGs). The PPS payment rates cover all operating and capital costs that IRFs would be expected to incur in furnishing intensive rehabilitation services. The base rate – \$14,076 for fiscal year 2012 – is adjusted by the hospital area wage index and casemix. In FFY 2009, Medicare payment per case for inpatient rehabilitation facility services was \$16,568, with an average length of stay of 13.1 days, representing an average per diem rate of \$1,265.
- **Denial of claims that group to rehabilitation APR-DRGs.** If a hospital submitted a claim that did not include a rehabilitation revenue code, it would flow through the DRG grouping and pricing logic. If the claim grouped to rehabilitation DRG 860 then it would be denied, with instructions to the hospital to resubmit the claim with a rehabilitation revenue code so it would price as rehabilitation.

**Table 5.5.1  
Rehabilitation Stays by DRG**

APR-DRG	Stays	Days	Charges	Est Cost	Baseline Payment	Cost / Chg	Pay / Cost	Avg LOS	Avg Chg	Avg Cost	Avg Pay
<b>All Rehabilitation DRGs</b>											
860-1 Rehab	195	3,459	\$15,754,060	\$3,887,789	\$5,680,484	25%	146%	17.7	\$80,790	\$19,937	\$29,131

*Notes:*

- For purposes of this table, rehab stays were defined by (A) all claims that grouped to APR-DRG 850 and 860, or (B) had a principal diagnosis code of V57.0, V57.1, V57.21, V57.22, V57.3, V57.4, V57.81, or (C) had diagnosis codes V57.89 or V57.9 or had procedure codes 93.85 or 93.89 anywhere on the claim or (D) any hospital identified as "rehabilitation" by name.

## 5.6 Remittance Advice

Analysis would be required regarding the impact of the new payment method on the paper and electronic (X12N 835) remittance advice sent by Medi-Cal to hospitals. Preliminary impacts to the remittance advice include providing the four-digit APR-DRG code and a remittance and remark code for payment reduction due to a health care-acquired condition.

## 5.7 Billing and Eligibility for Newborns

### 5.7.1 Billing for Newborns

Under the previous payment method, hospitals were advised to bill for well newborns (what we call normal newborns) on the same claim as their mothers.<sup>111</sup> Sick babies were to be billed on their own claims. If a sick baby was not admitted to a NICU, then treatment authorization was required for treatment provided after the mother was discharged. If a baby was admitted to the NICU, then treatment authorization was required starting from the day of NICU admission. The various permutations of cesarean vs. vaginal delivery, sick mother vs. well mother, sick baby vs. well baby, and contract hospital vs. non-contract hospital resulted in 30 pages of billing instructions to hospitals.<sup>112</sup>

In 2009, we estimate that 127,371 normal newborns were billed on their mothers' claims, excluding babies born at designated public hospitals and babies that are modeled as transitioning to managed care as of 2013.<sup>113</sup> For purposes of simulating DRG payment, we created inferred claims for these babies, as described in the *Summary of Analytical Dataset*, December 2011.

Under DRG payment, billing for these services will be quite different and much simpler.

- **Separate bills.** All babies should be billed on separate claims from their mothers. We recommend a CA-MMIS edit to deny claims that include both nursery revenue codes and labor and delivery revenue codes.
- **Separate payment.** Payment will be calculated under the DRG methodology, depending on the separate diagnoses, procedures and discharge statuses of the mother and the baby. There are 16 APR-DRGs for deliveries and 116 APR-DRGs for care of normal newborns and sick babies.
- **No TAR process for length of stay or induction of labor.** Under DRGs, payment will be irrespective of length of stay or whether labor was induced. Therefore, the previous TAR requirements regarding length of stay and induction of labor will no longer be needed. Treatment authorization will continue to be required for admission to neonatal intensive care. See Section 5.1.
- **No interim claims.** Interim claims will be denied unless the length of stay exceeds 30 days. See Section 5.2.2.

Separate claims and separate payments are consistent with the fact that the mother and the baby are separate patients with separate diagnoses, treatments, charges, length of stay, and discharge statuses. This separation also will enable greater understanding of the course of treatment and the quality of care in obstetrics and neonatology.

## 5.7.2 Eligibility Determination for Newborns

Claims for newborns in the first year of life may be submitted under either the baby's benefits identification card (BIC) or the mother's card. For normal newborns and other babies for whom only one claim is submitted, claims submission and payment is straightforward, regardless of which beneficiary number is submitted. CA-MMIS distinguishes between the two individuals by birthdate. Under DRG payment, each claim will be paid based on the diagnoses and procedures appropriate for that patient.

For sick babies with long lengths of stays and interim claims, however, it will be essential that the hospital submit all claims using the same beneficiary number. Otherwise, the process of submitting and reconciling interim claims (Section 5.2.2) would not work properly. The baby's number would be preferable, but the mother's number would be acceptable. Hospitals can help a mother obtain a BIC for her baby by completing and submitting Form MC-330, the newborn referral form.

## 5.8 Per Diem and Special Rates

As stated in Section 1.7, the DRG payment method will apply to hospital inpatient claims submitted for care in general acute care hospitals. Per diem rates are recommended for some types of stays not suited for DRG payment. Therefore, creation and maintenance of per diem rates is recommended for certain situations. With the dissolution of CMAC, these rates need to be established and maintained by DHCS. Special rates are already in place for hospice, and administrative days. Separately payable services, supplies, and devices have a special rate addressed in this section that is not technically "per diem," but billed by unit. These rates require maintenance. Rates already exist for services, supplies, and devices which are separately payable. The list of procedure codes to be paid separately will change; items on this list will require separate rates. In addition, we recommend that rates be established for a second level of administrative day and for interim claims.

Under the previous per diem payment method, it was rather simple to pay interim claims. Under DRG payment, interim billing will only be allowed for hospital stays in which the length of stay is greater than 30 days. Since a DRG price is set based on discharge diagnoses and procedure codes, the DRG rate cannot be established during a hospitalization. Please see Section 5.2.2. A rate must be established to pay this interim claim. Once the hospital stay is completed and the patient is discharged, the hospital will submit a final claim, so that the hospital stay is paid by DRG and the interim payments are voided. Therefore, this interim claim rate must be set at an appropriate level that incentivizes the hospital to submit the final claim. If the interim per diem rate is too high, hospitals could avoid the final billing procedure. This would result in a disruption of the DRG payment method and skewed incentives for hospitals. An appropriate interim rate is critical.

Please see Table 5.8.1 for the rates that must be maintained separately from the DRG payment method.

Table 5.8.1 Per Diem and Special Rates			
PDD Section	Rate	New / Existing	Action
1.10	Hospice	Existing	Annual maintenance
5.2.2	Interim	New	Creation and annual maintenance
5.4	Administrative Level 1	Existing	Annual maintenance
5.4	Administrative Level 2	New	Creation and annual maintenance
5.5	Rehabilitation	Existing	Annual maintenance
4.7	Separately payable services, supplies and devices	Existing	Annual maintenance. The current list is under review

# 6 Implications for Hospitals and DHCS

Provider consultation and education are essential to a successful implementation. It would be appropriate to schedule trainings for hospital billing, coding, utilization management and financial staff. Similar trainings would also be appropriate for fiscal intermediary and Department staff.

Some of the materials referenced in this document will be useful in these trainings. For example:

- Frequently asked questions (FAQ), a separate document referenced in Section 6.1
- DRG pricing calculator, provided in Section 6.2
- Summary of expected impacts on hospitals, provided in Section 6.3
- Payment policy flow chart, provided in Section 7.13

As of March 2012, the following consultation and education events have already occurred.

- Monthly consultation meetings hosted by the California Hospital Association (CHA)
- CHA Reimbursement Seminars in Sacramento, Glendale and Newport Beach held on June 21, 2011, June 28, 2011, and June 29, 2011, respectively
- HFMA educational session in Irvine held on August 11, 2011

## 6.1 Frequently Asked Questions

An FAQ document will be made available to any hospital staff, state staff, and others who may be interested in this project, including during the provider educational sessions and other presentation opportunities. Revisions to the FAQ will be made as decisions are finalized.

The FAQ document is also available to interested parties on the DHCS website at [www.dhcs.ca.gov](http://www.dhcs.ca.gov) under “Hot Topics.”

## 6.2 DRG Pricing Calculator

The DRG pricing calculator is a spreadsheet tool used for both hospital training and MMIS testing. As shown in the following pages, it shows the detailed pricing logic. At this time the values of the DRG base price, and certain other payment parameters, etc., have not been finalized and must be viewed only as illustrative.

The user enters the data on the dark violet background, and then the spreadsheet handles the calculations. Payment policy parameters and values are shown in light lavender background.

The following pages show different pricing scenarios.

## 6.2.1 Straight DRG

This is the simplest case, likely to apply to over 90 percent of inpatient stays once the new method is implemented (assuming no age adjustor). In this example, a 25-year-old patient spends two days in hospital for pneumonia, severity 3 (APR-DRG 139-3). The allowed amount is the DRG relative weight for DRG 139-3 times the DRG base price.

## 6.2.2 Straight DRG with Age Adjustor

In this case, the payer has chosen to pay certain DRGs at a higher rate for beneficiaries below a certain age. The clinical scenario is the same as in Section 6.2.1 except that the patient is 5 years old. For purposes of illustration only, we assume an age adjustor of 1.5, so the allowed amount is higher than in the previous scenario.

## 6.2.3 Acute Care Transfer Adjustment

In this case, the patient is transferred to another acute care setting, (discharge status 02, 05, 65, or 66). The payment to the transferring hospital may, or may not, be reduced. It depends on the actual length of stay relative to the benchmark length of stay (LOS). The benchmark is 5.47 days but the actual LOS is only two days, so payment is reduced. If the actual LOS had been five days or more, then payment would not have been reduced.

## 6.2.4 High-Side Outlier Adjustment

In this case, the patient is very costly for the hospital. Charges are \$150,000; if the hospital's cost-to-charge ratio is 35 percent then the estimated cost of this stay is \$52,500. Since the straight DRG payment is only \$7,150, the hospital's estimated loss is \$45,350. Since this amount exceeds the cost outlier threshold lower limit (illustrated as \$30,000), the stay is an outlier stay. The outlier adjustment increases payment by the marginal cost factor\_1 times \$45,350 – \$30,000, i.e., 60 percent x \$15,350 = \$9,210.

CALCULATOR VALUES ARE FOR PURPOSES OF ILLUSTRATION ONLY.					

## 6.2.5 High-Side Outlier Adjustment-Two-Step

In this case, the payer has chosen to buffer extreme losses by setting two outlier thresholds with corresponding marginal cost factors. The case is the same as in Section 6.2.4 except that the patient is extremely costly for the hospital. The hospital's estimated loss is \$273,000, which exceeds both cost outlier thresholds—on the lower limit (illustrated as \$30,000) and on the higher limit (illustrated as \$100,000). Two outlier adjustments increase the DRG base payment by \$180,280—marginal cost factor\_1 (illustrated as 60 percent) and marginal cost factor\_2 (illustrated as 80 percent).

## 6.2.6 Low-Side Outlier Adjustment

In this case, the hospital makes a large gain. We use a liver transplant as an example of a high-paying DRG (\$154,441). We also assume a very short and inexpensive stay, with hospital cost of only \$17,500. The hospital makes a gain of \$148,316. The outlier adjustment reduces payment by the marginal cost factor\_1 times \$148,316 – \$30,000, i.e., 60 percent x \$118,316 = \$70,990.

## 6.2.7 Partial Eligibility

In this case, the patient has one day of Medicaid eligibility within a two-day stay and there is an A2 or A3 occurrence code value on the claim. As with the transfer adjustment, a per diem amount is calculated by dividing the DRG base payment by the national average length of stay. The hospital is then paid the lower of the full DRG payment or the per diem amount times the actual length of stay.

## 6.2.8 Interim Claim

In this case, the beneficiary is still a patient (discharge status 30) and the actual length of stay is more than 30 days. Payment is calculated by the per diem method: the interim per diem amount (illustrated as \$600) times the actual length of stay (illustrated as 31 days). At the end of the hospital stay, the hospital submits a final claim for the complete stay and voids earlier interim claims so that the claim can be priced as a complete DRG claim.

66	Add-on amount	\$0.00	Hospital-specific payment separate from DRG payment (not used at this time)		
67	Allowed amount	\$18,600.00	IF E36="Yes", then E38, else E64+E66		
68	Other health coverage	\$0.00	E12		
69	Patient share of cost	\$0.00	E13		
70	Payment amount	\$18,600.00	IF (E67-E68-E69)>0, then E67-E68-E69, else 0		

## 6.3 Expected Impacts on Hospitals

Table 6.3.1 summarizes the project's impacts on hospital operations and finances.

Table 6.3.1 Expected Impacts on Hospital Operations and Finances (Listed in approximate declining order of impact)		
PDD Ref.	Item	Comment
3.6, 6.7	Financial impact of new payment method	Intended to be budget neutral overall, but individual hospitals will see increases or decreases.
5.1	Treatment Authorization Request process	TAR no longer required on length of stay for the vast majority of days. See Tables 5.1.1 and 5.1.2 for more detail.
2.2.2	Increased importance of diagnosis and procedure coding	Assignment of base APR-DRG and level of severity is driven by the number, nature and interaction of comorbidities and complications. There is no single list of complications and comorbidities.
5.7.1	Mother and newborn to be billed on separate claims	Separate payment will be made for each stay.
5.7.2	Newborns with long lengths of stay and multiple claims must be billed with the same Medicaid number on each claim, preferably the baby's number.	Because payment will be by stay, submission of the mother's beneficiary number on some claims and the baby's beneficiary number on other claims would be problematic.
5.2.2	Interim bill types 112, 113, and discharge status 30 only accepted for stays exceeding 30 days. Interim bill type 114 not accepted.	When the patient is discharged, interim claims submitted previously should be replaced or voided. DRG payment would depend on a single admit-through-discharge claim.
5.4	Administrative days	Admin days to be billed on separate claim, with admin days identified by revenue code. A new Level 2 admin day is recommended to pay more than the existing Level 1 admin day for sub-acute patients who require more care than Level 1.
2.2.2	Four-byte APR-DRG code	Impact depends on how the hospital's billing system is configured. APR-DRG = three-bytes for the base DRG and 1 byte for level of severity (format 123-4).
5.4	Partial eligibility	When the patient has Medi-Cal fee-for-service eligibility for only part of the stay, indicate the situation with occurrence code A2 or A3 as applicable. Occurrence code A3 will also enable a claim to be paid even if has discharge status 30 (still a patient).
5.5	Rehabilitation stays	Rehabilitation days to be billed on separate claim, identified by revenue code. Payment will be per diem.
4.10.1	Present-on-admission indicator	Submit claims with a valid present-on-admission value for each diagnosis (except for exempt diagnoses codes, which are blank per 5010).
4.7	Separately payable services, supplies and devices	In the few situations where separate payment is allowed, a separate outpatient claim should be submitted.
5.2.1	Late charges (bill type 115) not accepted	Submit a claim adjustment instead.
4.10.1	Health care-acquired conditions	Payment may be reduced if a HCAC is present on the claim.
4.10.1	Erroneous surgeries	Erroneous surgeries should be billed with the appropriate E code.

## 6.4 Policy Documentation

Policy documentation for the new payment method is expected to include updates to regulations, the Medicaid state plan amendment, and the provider billing manual.

Xerox will assist DHCS in the preparation of policy documentation.

## 6.5 Policy Update and File Maintenance Tasks

Periodic reviews, updates and maintenance – at least annual – are essential to the proper functioning of any DRG-based payment method. Table 6.5.1 summarizes these tasks.

Table 6.5.1 MMIS Reference Update and File Maintenance Tasks						
PDD Ref.	MMIS File	Payment Policy	Recommended Schedule	Primary Resp.	Other Depts Involved	Notes
2.3, 2.4.2	N/A	Diagnosis and procedure code mapper	Each October 1, unless grouper version is current	Fiscal intermediary (FI)		See PDD Section 2.4 on the grouper version and ICD-10
2.3, 2.4.2	DRG	APR-DRG version	Install new version each year	Fiscal intermediary		V.29 to be implemented 1/1/13
2.3	DRG	APR-DRG labels	Each time grouper version is updated	Fiscal intermediary		
2.5	DRG	APR-DRG relative weights	Each time grouper version is updated	Fiscal intermediary		
4.1.1	DRG	APR-DRG average length of stay data	Each time grouper version is updated	Fiscal intermediary		
4.2	Parameter	APR-DRG outlier thresholds	Update annually	DHCS-SNFD		Thresholds should be updated for inflation even if the DRG version is unchanged
3.3	Provider	Hospital-specific DRG base prices	Review annually	DHCS-SNFD	FI and/or PED	Review and update hospitals' Medicare wage area assignment (including reclassifications) and indices
3.4	Provider	Hospital-specific DRG base prices	Review annually	DHCS-SNFD	FI and/or PED	Review and update hospitals' remote rural status
4.2	Provider	Hospital-specific cost to charge ratio	Update annually	DHCS-A&I	SNFD, PED	CCRs tend to decline over time, so it's important to update values annually
3.1	N/A	Estimate fiscal impact of changes in grouper, relative weights, DRG base prices	Each time there are significant changes in DRG version, relative weights or DRG base prices	DHCS-SNFD		

Table 6.5.1

## MMIS Reference Update and File Maintenance Tasks

PDD Ref.	MMIS File	Payment Policy	Recommended Schedule	Primary Resp.	Other Depts Involved	Notes
4.2	DRG	Marginal cost factor used in outlier calculations	Review annually	DHCS-SNFD		Simulation values are 60% and 80%
4.2	DRG	Percentages of payments made as high-side outliers and low-side outliers	Review annually	DHCS-SNFD		Initial target is approximately 10%
2.6	DRG	Policy adjustors	Review annually	DHCS-SNFD		Review and update hospitals designated NICU status
2.8	DRG	Age adjustor	Review annually	DHCS-SNFD		Decision pending
5.2.2	Parameter	Per diem payment amount for interim claims	Review annually	DHCS-FFSR	SNFD, PED	Decision pending
5.4	Provider	Per diem payment amount for administrative day Level 1 and Level 2	Review annually	DHCS-FFSR	SNFD, PED	Decision pending
5.5	Provider	Per diem payment amount for rehabilitation services	Review annually	DHCS-FFSR	SNFD, PED	Decision pending
3.5	Provider	Documentation, coding and capture adjustment to the DRG base price	Review monthly	DHCS-SNFD	A&I and/or PED	Decision pending Calculate statewide casemix monthly and quarterly for first and second year. Suggest quarterly or semiannually thereafter. Adjust DRG base price prospectively.
4.7	N/A	Separately payable services, supplies and devices	Review annually	DHCS-SNFD		Review list of HCPCS codes and applicable fees.

*Notes:*

- 1 FFSR = Fee-for-Service Rates
- 2 PED = Provider Enrollment Division
- 3 SNFD = Safety Net Financing Division
- 4 A&I = Audits and Investigations

## 6.6 Monitoring Payment Method Integrity

The most important decision in any payment method is the unit of payment. Whatever the unit of payment, the provider's financial incentive is to increase the number of units for which it is paid and to decrease its own cost per unit. For example:

- If payment is at a percentage of charges, the incentives are to increase charges while reducing cost, resulting in continuing decreases in the cost-to-charge ratio (as has been seen nationwide in the hospital industry)
- If payment is at a percentage of cost, the incentives are to increase cost and also to try to allocate costs to those services paid on a cost reimbursement basis.
- If payment is by fee schedule, the incentives are to increase the number of services while reducing the cost of those services (as has been seen in physician care nationwide)
- If payment is per diem, the incentives are to increase the number of days of care and decrease the cost per day. (In the Selective Provider Contracting Program (SPCP), the incentive has also been to put time and effort into negotiating the hospital-specific per diem rates.)
- If payment is per stay (e.g., by DRG), the incentives are to increase the number of stays and decrease the cost per stay, especially by decreasing length of stay.

We don't mean to imply that there is anything inappropriate in providers responding to these incentives. Hospital executives, like everyone else, are motivated by financial incentives among other factors. Indeed, payment method designers choose the unit of payment in an effort to motivate providers in specific ways. Our point is simply that the movement from negotiated per diem rates and cost reimbursement (on the one hand) to payment per stay using APR-DRGs (on the other hand) represents an important change in the financial incentives facing Medi-Cal hospital providers. We expect it to result in slower growth in cost per stay, due in particular to decreased length of stay; increased access for patients needing expensive, specialized services (because of higher rates for these services under APR-DRGs); increased attention to reducing cost in existing non-contract hospitals; and less effort spent on determining hospital-specific payment levels.

Because of the change in incentives, some current Medi-Cal efforts to monitor the integrity of the payment method will no longer be as necessary as they have been in the past. Examples are:

- ***Negotiating per diem rates for approximately 190 contract hospitals.*** This function has been performed by the California Medical Assistance Commission (CMAC), which operates the SPCP. Although CMAC will be dissolved on June 30, 2012, DHCS will continue to operate the SPCP until implementation of the new payment system on January 1, 2013.

- **Settlement of cost reports for approximately 170 non-contract hospitals.** This function has been performed by the DHCS Audits and Investigation Division. We note, however, that submission and auditing of cost reports will continue to be necessary, since these reports are used in calculating certain supplemental payments. Cost settlement, however, will not be needed. We also note that it is very useful to calculate pay-to-cost ratios in monitoring the performance of any inpatient hospital payment method, including DRGs.
- **Treatment authorization of every day of care.** This function has been performed by the DHCS Utilization Management Division (UMD). For the hospitals that are within the scope of the new payment method, we estimate that UMD's workload in 2013 will drop from 1.1 million days to 120,000 days. We note that TAR will continue to be required for the medical necessity of admission for all non-obstetric stays, just not for the length of stay.

In place of these efforts, however, it will be necessary to devote resources to monitoring the following aspects of the new payment method. In part, such efforts are needed to guard against excess use of services and payments (as required under, e.g., 42 CFR 456). They are also prudent investments in maintaining the integrity of the payment method. In (approximately) declining order of importance, these include the following.

1. **Coding validation: diagnosis and procedure codes.** Often the easiest way for a hospital to increase its DRG payments is to improve the completeness of diagnosis and procedure coding. In many cases this is expected and completely appropriate. Nevertheless, Medi-Cal should closely monitor changes in reported casemix, both overall and on a hospital-specific basis. One reason is simply that overall casemix drives overall payment, so understanding trends is essential in forecasting DHCS spending. As well, as in every other realm of human activity, there will be individual hospitals that are inappropriately aggressive in coding diagnoses and procedures. Many consultants specialize in advising hospitals on how to increase their DRG payments under Medicare while avoiding fraudulent practices. They can be expected to expand their scope to Medi-Cal, especially in the areas of obstetrics, newborn care and pediatrics where complete coding has never been important for purposes of Medicare payment.
2. **Ensuring the medical necessity of admission.** Medi-Cal already reviews the medical necessity of the admission for all stays except deliveries and normal newborns. Were this requirement not already in place, it would be necessary to implement monitoring of medical necessity in some form. As part of monitoring, we recommend post-payment review of short stays, such as one-day stays. A short stay is often explicable (e.g., patient died, left against medical advice, serious condition ruled out, was stable after emergency treatment such as angioplasty, etc.) and it would be wrong to automatically deny or cut back payment for short stays. Nevertheless, an unusually high proportion of short stays might indicate a tendency to admit patients without medical necessity.

3. **Monitoring particularly expensive stays.** In every Medicaid program, a few stays are extremely expensive. Under DRG payment, for example, we expect the top 3 percent of stays to represent approximately 34 percent of total payments. These stays typically involve neonatal intensive care, transplants, tracheostomy patients, or patients with multiple serious illnesses such as septicemia and kidney failure. For some of these stays, the base DRG payment will be high enough that no separate cost outlier payment will be made. For other stays, payment will comprise the base payment plus an outlier payment. At minimum, we recommend that DHCS review a monthly report showing the top 100 (or more) individual stays in terms of Medi-Cal payment. The data for each stay should “fit together” in terms of diagnoses, procedures, APR-DRG assignment, length of stay, billed charges, and Medi-Cal payment. DHCS may also want to consider concurrent review of unusually expensive stays. The most straightforward way to operationalize such a policy would be to require treatment authorization once a stay exceeds a certain day threshold, e.g., 30 days. See Section 5.1.
4. **Monitoring transfers to sub-acute care, especially within the same hospital.** Hospitals will have incentives to cut short the acute stay (for which it is paid per stay) and transfer the patient to administrative days or rehabilitation. As a safeguard, administrative days and rehabilitation days will require TAR on both the admission and each day. Monitoring premature discharges for the acute stay could be part of the TAR review.
5. **Ensuring correct reporting of discharge status and partial eligibility.** The presence on the claim of discharge statuses 02, 05, 65, or 66, or occurrence codes A2 or A3 could result in reduced payment, as described in Section 4.1 and 4.4. As well, APR-DRG 581 (Neonate, transferred <5 days old, born here) is intended for those situations where a baby is transferred to neonatal intensive care at another hospital. If the transfer status was not coded, the hospital potentially could receive a much higher payment. Therefore, it would be appropriate to verify that discharge status and occurrence values are, in fact, being reported when appropriate.
6. **Monitoring services within the “outpatient window.”** Previous policy, under which emergency services provided in the 24-hour period before admission are bundled within the stay, but all other outpatient services may be billed separately, would continue. Monitoring should address whether ER services are, in fact, being bundled within the stay. As well, it would be useful to monitor the volume of outpatient services being billed and paid separately, in case a future policy change to widen the window might be appropriate. See Section 5.3.
7. **Monitoring premature discharges.** Since the start of DRG payment over 30 years ago, hospitals and payers have recognized the incentive to reduce length of stay. Many initiatives, such as performing pre-operative tests before admission, have improved efficiency without demonstrably adverse effects on patient care. Premature discharge remains a concern even though, in practice, it has not been as big an issue as was originally feared.<sup>114</sup> We recommend that DHCS monitor sentinel events that may indicate a pattern of premature discharge. Such sentinel events include patient complaints and readmissions for the same or a closely related condition.

8. **Monitoring separately payable services, supplies and devices.** If separate payment is allowed for certain services, supplies and devices, then it would be appropriate to monitor billing and payment for these items. The reason is that hospitals automatically receive extra payment whenever these items are billed. See Section 4.7.
9. **Monitoring interim payments.** For stays exceeding 30 days, hospitals that choose to bill an interim claim would receive interim payment. When the patient is discharged, the hospital would be required to submit a single admit-through-discharge claim so that final payment could be calculated under the DRG payment method. The interim payment amount per diem would be set low enough that hospitals would not have an incentive to keep the interim payment and not submit a final claim. Nevertheless, we recommend periodic monitoring to ensure that final discharge claims are being submitted.
10. **Coding validation: present-on-admission indicators.** CA-MMIS can be set to require valid values for the present-on-admission indicators attached to each diagnosis code, but it cannot ensure that the POA values are coded appropriately by the hospital. In particular, a payer should ensure that the value blank=Exempt is used appropriately and the value W=Clinically undetermined is used as little as possible. Use of the value Y=Yes (Present-on-admission) should also be corroborated by the medical record. In terms of priority, we mention this concern last because the policy on health care-acquired conditions will affect so few stays (Section 4.10.1). If the HCAC policy broadens in scope, then this concern would move up the list.

Monitoring the integrity of the payment method has several aspects.

- **Legal authority.** We recommend that DHCS review its statutory and regulatory authority to ensure that it can take action as necessary to ensure the integrity of payment under a DRG method. Such a review would be necessary because its current authority was written within a different payment environment.
- **Provider training.** Provider training can be very useful in heading off problems, for example by educating hospitals about the need to code discharge status and occurrence codes correctly. Such training also serves as notice that the payer regards certain issues as important to the integrity of the payment method.
- **Routine reports.** As with any payment method, routine reports will help DHCS monitor both the overall performance of the payment method and any individual anomalies that would merit further review. In general, we recommend that routine reports be generated from a Medicaid program's data warehouse, but they also could be generated from CA-MMIS. Some sample reports, based on our experience in other states, are listed in Table 6.6.1.
- **Data analysis.** As a general rule, we recommend against broad-brush policies such as "Every short stay must be reviewed by DHCS." Instead, we believe a more efficient use of resources is to perform an overall data analysis to identify (in this example) hospitals that appear to have a large proportion of short stays.<sup>115</sup> An analyst could then focus the analysis by looking for patterns, e.g., by APR-DRG or discharge status. Only after initial data analysis has identified anomalies would be it necessary to undertake expensive and time-consuming chart review.

- Activities by other DRG payers.** Medicare, in particular, is a useful source of information. The Office of Inspector General is the lead agency for monitoring the integrity of the MS-DRG payment method. Its annual workplan<sup>116</sup> lists the issues it thinks deserves attention. It also issues audit and investigation reports on topics such as outlier payments, documentation and coding improvement, etc. The Medicare Payment Advisory Commission (MedPAC) routinely advises Congress on the performance of the payment method. The Government Accountability Office, the Congressional Budget Office and various think tanks and other organizations also publish research on Medicare inpatient payment. The recently established Medicaid and CHIP Payment and Advisory Commission (MACPAC) is also expected to be a useful source of comparative information across states. Lastly, other Medicaid programs using or planning to use APR-DRG payment methods include Maryland, Montana, New York, Pennsylvania, Rhode Island, South Carolina, and Texas.

Table 6.6.1 Examples of Routine Reports						
No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
1	Monthly	Summary of payments by Medicaid Care Category	Review trends in spending, utilization and casemix by Medicaid Care Category (MCC). See Section 6.6, #1.	All claims paid by DRG	Medicaid Care Category	Medicaid Care Category, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
2	Monthly	Summary of payments by APR-DRG	Review most common DRGs, analyze average charges and payments, analyze outlier payments as percentage of all payments, compare average length of stay against benchmark	All claims paid by DRG	APR-DRG (four-digit)	APR-DRG code, APR-DRG description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay. Also national average length of stay (from DRG file) Sort: Total stays, descending
3	Monthly	Summary of payments by hospital	Review list of top hospitals by total payments, analyze average charges and payments, analyze outlier payments as percentage of all payments	All claims paid by DRG	Hospital NPI	Hospital NPI, hospital name, in/out of state indicator, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
4	Monthly	Highest-paying claims	Check appropriateness of billed information and payment calculations on the most expensive claims. See Section 6.6, #3.	All claims paid by DRG (top 100 by total price)	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status Sort: Price, descending

Table 6.6.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
5	Monthly	Summary of payments by DRG pricing method	Analyze how claims are being paid, prevalence of straight DRG claims vs. outlier claims etc. See Section 6.6 #5.	All claims paid by DRG	Unique combination of DRG pricing method and DRG outlier indicator	DRG pricing method indicator, DRG pricing method description, DRG outlier indicator, DRG outlier indicator description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
6	Monthly	DRG cost outlier payments	Review outlier claims by hospital to trend hospital utilization requiring outlier payments. These claims may require more oversight from DHCS UMD.	All claims paid by DRG with DRG cost - and - outlier payment not equal to \$0	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status. Also national average length of stay (from DRG file). Sort: Cost outlier amount, descending
7	Monthly	Payments by patient discharge status	Analyze patterns of discharge destination. See Section 6.6 #5.	All claims paid by DRG	Discharge status	Discharge status, discharge status description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
8	Monthly	Interim claims	Review claims that will likely be high-paid (either outlier or high DRG base payment). These claims could be monitored by DHCS UMD after the initial 30 days.	All claims paid by DRG with discharge status = 30 - or - bill type = 112, 113	CCN	CCN, hospital NPI, hospital name, first date of service, last date of service, days, charges, estimated hospital cost, price, discharge status, all diagnosis and ICD-9-CM procedure code values and descriptions. (Interim claims do not have DRG assigned.) Sort: Hospital NPI, then beneficiary ID, then FDOS

Table 6.6.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
9	Monthly	Interim claims with no final claim	Identify situations where interim claims were submitted but no final claim was submitted. DHCS can remind hospitals to submit the final claim and or decide upon a policy, if required, to ensure that final claims are submitted. See Section 6.6, #9	Interim claims paid two months prior for which no final claim has been received. For example, a report generated at the end of April should list all interim claims paid in February for which no final claim was paid in March or April.	CCN	CCN, hospital NPI, hospital name, beneficiary ID, first date of service, last date of service, type of bill, patient discharge status charges, estimated hospital cost, price.  Interim claims are identified by patient discharge status = 30. Final claims are identified by patient discharge status equal to anything other than 30.  The report should include all interim claims for a hospital stay. Using the example of a report run in April, if an interim claim was found paid in February and did not have a final claim, then the report should also include any other interim claims for the same hospital stay. Other interim claims for the same hospital stay will be identified as having the same beneficiary ID, provider number, and admit date.  Sort: Hospital NPI, then beneficiary ID, then FDOS
10	Monthly	Short stays	Monitor possible patterns of premature discharge. See Section 6.6, # 2 & 7.	All claims paid by DRG where the LOS < 0.25 x national ALOS, subject to the restriction that ALOS > 10 days	CCN	CCN, APR-DRG, hospital NPI, hospital name, first date of service, last date of service, length of stay, national ALOS, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status  Sort: Hospital NPI, then APR-DRG, then beneficiary ID
11	Monthly	Long stays	Analyze prevalence and payment for long stays, which tend to be expensive, medically complex and/or difficult to discharge.	All claims paid by DRG with length of stay > threshold (e.g., 30 days)	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, LOS, DRG LOS, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status.  Sort: Hospital NPI, then APR-DRG, then beneficiary ID

Table 6.6.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
12	Daily	Suspect duplicate or unbundling situation	Identify situations where there is more than one paid claim a single inpatient stay. See Section 6.6, #6, #8	Paid claims for the same patient with overlapping FDOS→LDOS date spans, hospital inpatient or hospital outpatient bill type	CCN	CCN, APR-DRG, hospital NPI, hospital name, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status, admin date, discharge date, LOS, bill type Sort: Beneficiary ID, then FDOS, then hospital NPI
13	Monthly, quarterly	Health care-acquired conditions (HCAC) - Systematic Payment Adjustment	To support HCAC reporting to CMS. See Section 4.10.1.	All claims paid by DRG where the HCAC field indicates the presence of HCAC	CCN	CCN, hospital NPI, hospital name, pre-HCAC DRG code, pre-HCAC DRG casemix relative weight, post-HCAC DRG, post HCAC DRG casemix relative weight, days, charges, estimated hospital cost, HCAC category, HCAC payment reduction indicator, post-HCAC price, pre-HCAC price Sort: Hospital NPI, then HCAC category
14	Monthly, quarterly	Health care-acquired conditions (HCAC) – Manual Payment Adjustment	These indicate claims that require manual review of the HCAC in order to price the claim because to reflect Medi-Cal HCAC policy.	All claims NOT paid by DRG where the HCAC field indicates the presence of HCAC	CCN	CCN, hospital NPI, hospital name, pre-HCAC DRG code, pre-HCAC DRG casemix relative weight, post-HCAC DRG, post HCAC DRG casemix relative weight, days, charges, estimated hospital cost, HCAC category, HCAC payment reduction indicator, price Sort: Hospital NPI, then HCAC category
15	Quarterly	POA Indicators	Evaluate the appropriate use of POA indicators by trending the frequency of all values. See Section 6.6, # 10.	All claims	POA	Hospital NPI, hospital name, total # of claims, POA field (e.g., values Y, N, W etc.). Sort: Total stays, descending

*Notes:*

- 1 Sample reports are listed for consideration by DHCS, and would have to be configured to reflect specific data fields in CA-MMIS or the paid claims warehouse.
- 2 CCN=claim control number, LOS=length of stay for the specific claim; ALOS=national average length of stay for the specific APR-DRG.
- 3 Casemix equals average DRG relative weight. For purposes of reporting, casemix should be measured without reference to any policy adjusters. The reason is that the casemix weights serve as national benchmarks and should change only when national data change.
- 4 Estimated hospital cost is calculated as submitted-charges times hospital cost-to-charge ratio.
- 5 All reports should include a total line.

## 6.7 Implications for Growth in Hospital Cost

After Medicare implemented DRG payment in 1983, a top hospital industry executive testified to Congress that it was “the most effective cost-containment program ever enacted, successful beyond anyone’s expectations.”<sup>117</sup> The strong incentives to control cost enabled billions in savings nationwide. As a result, Medicare’s growth in payments slowed dramatically even while hospital margins on Medicare patients hit record levels.

The effects of Medi-Cal’s implementation of DRG payment will not be nearly as dramatic. In retrospect, U.S. inpatient care in the 1970s and early 1980s was rife with inefficiency, all enabled by cost-based and charge-based reimbursement by Medicare and other payers. Although payers tried to write rules to control costs, their efforts were ineffectual compared with what hospitals could do themselves with the appropriate incentives.

That said, we do think it is likely that DRG payment will help reduce the growth rate in hospital cost over time. The essential reason is that under DRG payment a hospital’s revenue is fixed regardless of the hospital’s actual cost (except for outlier stays). Therefore any reductions in cost will flow straight to the hospital’s bottom line. Just as we saw in Section 3.6.1 when discussing the impact of decreased revenue on hospital profits, the impact on profit is much larger than the impact on total cost. If Medicaid represents 4% of total cost in a hospital with a 2% margin, then a 10% decrease in Medicaid cost would increase profit 20% in dollar terms.<sup>118</sup> Although the new payment method will be implemented on a budget-neutral basis, over time the greater efficiencies will mean less pressure on DHCS to continually increase hospital payments. This dynamic process was most evident with Medicare in the 1980s, which prompted Congress to extend prospective payment principles to other settings, notably hospital outpatient care, nursing facility care, home health care, psychiatric hospitals, and rehabilitation hospitals.<sup>119</sup>

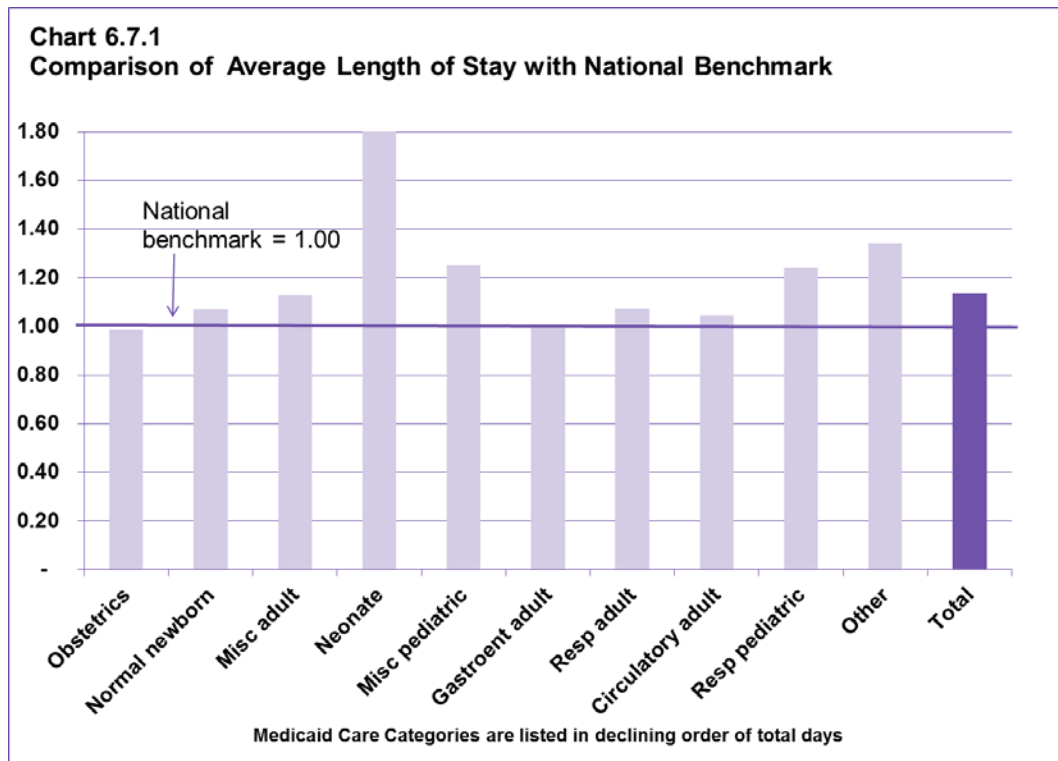

In the Medi-Cal fee-for-service population, where are the potential areas of efficiency improvement? In 2013, we expect that almost four-fifths of Medi-Cal FFS stays, representing about 57% of payments, will be in the clinical areas of obstetrics and nursery, newborn intensive care, and pediatrics.<sup>120</sup> Medi-Cal payment methodology has substantial influence in these areas, where Medi-Cal accounts for approximately half of hospital volume, and more than half for many hospitals.<sup>121</sup> These market share figures include managed care, which is outside the scope of DRG payment, but the fee-for-service incentives still will have an impact. We also note that the incentives of Medicare DRG payment have left these clinical areas largely untouched, reflecting Medicare’s very low share of the business.

In 2013, we estimate that 23% of Medi-Cal FFS stays (representing 21% of estimated hospital cost) will be at hospitals that were reimbursed for 100% of cost under the previous payment method. These hospitals were previously penalized if they reduced average length of stay or cost per day; under DRG payment, they will retain any savings from efficiency improvements.

The other 77% of stays (representing 23% of estimated hospital cost) will be at hospitals that previously were paid contractual rates under the Selective Provider Contracting Program. Because the per diem rates were fixed, these hospitals already had incentives to minimize cost per day. However, their previous incentive was to maximize length of

stay; now it will be to minimize length of stay. Although length of stay previously was subject to the treatment authorization request process, experience in Medicare and elsewhere suggests that the hospitals will be more effective in gaining length of stay efficiencies than the TAR process.

Chart 6.7.1 and Table 6.7.1 show comparisons of average length of stay in the simulation dataset with average length of stay (ALOS) at the national level, with both sets of data adjusted for casemix using APR-DRG V.29. A quick look shows the Medi-Cal ALOS as 13% higher than the national benchmark, with the difference representing 240,046 days with \$530 million in associated hospital cost.<sup>122</sup> However, these figures certainly overstate the potential savings. The chart shows that the “neonate” category has average length of stay 82% higher than the national benchmark. Although some of this gap appears to reflect genuine differences in length of stay, the gap also appears to reflect incomplete documentation, coding and capture of diagnosis and procedure codes for sick babies. For example, APR-DRG 634-1, Neonate, Birthweight >2499 Grams with Major Respiratory Condition, has an average length of stay of 26.1 days or nearly six times higher than the national benchmark. But only 49 of the 1,142 claims in the simulation dataset assigned to this DRG included a birthweight on the claim record. If a baby had a major respiratory condition but the birthweight was unspecified, then the grouping algorithm assumed a normal birthweight and defaulted to DRG 634. Within this DRG, the average length of stay was 18.4 days for claims with a birthweight but 26.6 days for claims without a birthweight, which strongly suggests that many the claims were actually for premature babies.

Because of these potential confounding influences, we have split Table 6.7.1 into non-newborn DRGs and newborn DRGs. For the non-newborn stays, average length of stay was 8% higher than the national benchmark, with associated cost of \$328 million. Even though improved documentation, coding and capture would probably also have some impact on future DRG assignment, the table strongly suggests that there are potential savings to be gained from reducing length of stay under DRGs. For the newborn stays, presumably not all of the 82% difference in days reflects documentation, coding and capture, so we expect there also would be room for efficiency gains. It would be difficult to estimate the magnitude, however.

We should also note some countervailing forces. In reducing length of stay, hospitals may be constrained by California statute on minimum lengths of stay for deliveries. It is also possible that the rate of increase of hospital cost may be reduced in coming years, but that Medi-Cal will be unable to share in any savings. The most likely reason would be higher-than-expected increases in casemix due to improved documentation, coding, and capture of diagnosis and procedure codes, as discussed in Section 3.5.

Table 6.7.1 Comparison of Average Length of Stay with National Benchmarks									
DRG	DRG Description	Stays	Days	Est. Hospital Cost	ALOS	Natl ALOS	Ratio	Days Over Benchmark	Associated Cost

# 7 Business Requirements for CA-MMIS Changes

This section lists all the business requirements for implementation of APR-DRG pricing for Medi-Cal. Software changes are expected to be needed within the mainframe portion of CA-MMIS and within both Treatment Authorization Review (TAR) data entry applications, Service Utilization Review Guidance and Evaluation system (SURGE) and Service Authorization Request system (SAR). In addition, data repositories downstream of the claims adjudication process, such as Surveillance and Utilization Review Subsystem (SURS) and the Information Technology Services Division (ITSD) decision support system (DSS) will need to be updated to capture a few new fields related to DRG pricing.

## 7.1 Summary of Requirements

The business requirements are listed in summary form in Table 7.1.1 below and then explained in more detail in the sections that follow. The requirements are categorized by our best estimate of what area of CA-MMIS will be affected by each requirement.

Table 7.1.1

## Summary of APR-DRG Business Requirements

Requirement Number	CA-MMIS Area /Sub-system	Requirement Description
<b>Reference Sub-System</b>		
BR-Ref-1	Reference sub-system	Add new system parameters and lists
BR-Ref-2	Reference sub-system	Define new adjudication edits
BR-Ref-3	Reference sub-system	View and update new Reference DRG pricing file online
BR-Ref-4	Reference sub-system	Batch update process for DRG pricing file
<b>Provider Master File</b>		
BR-Prov-1	Provider sub-system	Allow new fields to be viewable and updateable by staff that maintain the provider master file
BR-Prov-2	Provider sub-system	Batch update for new fields supporting DRG pricing
<b>TAR Entry – SURGE and SARS</b>		
BR-TAR-1	TAR data entry	TAR the admit only, not individual days of a hospital stay, for most stays priced using DRGs
<b>Claim Data Entry</b>		
BR-Clm-Entry-1	Claim data entry	Capture additional fields on inpatient claims
<b>Adjudication Edits</b>		
BR-Adj-Edit-1	Adjudication	Pricing method edits
BR-Adj-Edit-2	Adjudication	Inpatient claim data validity edits
BR-Adj-Edit-3	Adjudication	Hospital-acquired condition and erroneous surgery edits
BR-Adj-Edit-4	Adjudication	DRG pricing parameter edits
BR-Adj-Edit-5	Adjudication	DRG grouping edits
BR-Adj-Edit-6	Adjudication	Post DRG grouping edits
BR-Adj-Edit-7	Adjudication	TAR edits
<b>Claims Pricing</b>		
BR-Pricing-1	Pricing	Add branching logic
BR-Pricing-2	Pricing	Retrieve additional claim data needed for DRG pricing
BR-Pricing-3	Pricing	Add call to diagnosis and procedure code mapper
BR-Pricing-4	Pricing	Build DRG grouping input record
BR-Pricing-5	Pricing	Call health care-acquired condition utility
BR-Pricing-6	Pricing	Add calls to DRG grouping software
BR-Pricing-7	Pricing	Add logic to perform DRG pricing
BR-Pricing-8	Pricing	Store DRG pricing values
BR-Pricing-9	Pricing	Allow users the ability to view claim DRG pricing fields
BR-Pricing-10	Pricing	Price administrative day level 2 claims similarly to administrative day level 1
BR-Pricing-11	Pricing	Add new rehabilitation service per diem pricing logic
<b>Processing Final Claim After Interim Claims</b>		
BR-Final-Clm-1	Adjudication	Voiding interim claims
<b>Reporting DRG Pricing Information</b>		
BR-Rptng-1	Reporting	Remittance advice
BR-Rptng-2	Reporting	Standard DRG pricing reports
BR-Rptng-3	Reporting	Data warehouse extracts

Table 7.1.1

## Summary of APR-DRG Business Requirements

Requirement Number	CA-MMIS Area /Sub-system	Requirement Description
<b>Database Changes</b>		
BR-DB-1	Database	Reference DRG pricing file
BR-DB-2	Database	Provider Master File
BR-DB-3	Database	Claim input from provider side file
BR-DB-4	Database	Claim DRG pricing file
<b>Data Configuration</b>		
BR-Config-1	Reference and Provider sub-systems	Initial implementation configuration tasks
<b>Unresolved Requirements</b>		
BR-Unreslvd-1	Unresolved	CCS and non-CCS payment on a single stay
<i>Notes:</i>		
1	Some adjudication edits may get added in daily adjudication, while others may make more sense to add in weekly adjudication. Final decision on placement of these edits will be made during the technical design phase.	

## 7.2 Reference Data System

### BR-Ref-1: Add new system parameters and lists

Several new system parameters and four new system lists will need to be added. The parameters and lists are defined in the following table.

A system parameter / list file already exists in CA-MMIS so no database changes are needed for this requirement.

Table 7.2.1 New System Parameters and Lists			
Parameter	Format	Tentative Initial Value	Notes
<b>System parameters – One Value</b>			
DRG cutover date	Date	01/01/2013	
Casemix adjustment factor	Numeric	1.000	This will be used to reduce or increase all DRG payments by a specific percentage. It is a multiplier that will be applied to all non-interim claims paid via DRGs.
DRG high (provider loss) cost outlier threshold 1	Numeric, dollar amount	\$30,000	All claims with provider loss over this amount will get paid an outlier
DRG high (provider loss) cost outlier threshold 2	Numeric, dollar amount	\$100,000	Claims with provider loss less than this value will receive marginal cost percent 1. Claims with provider loss greater than or equal to this value will also receive marginal cost percent 2.
DRG low (provider gain) cost outlier threshold	Numeric, dollar amount	\$30,000	Value is expected to be equal to DRG high side cost outlier threshold 1.
DRG outlier marginal cost percent 1	Percentage or numeric	0.60 or 60%	
DRG outlier marginal cost percent 2	Percentage or numeric	0.80 or 80%	
DRG age threshold	Numeric	21	Beneficiaries with age less than this value will get DRG relative weight age adjustors
Installed DRG version number	Character string	290	
Federal fiscal year begin date for installed DRG version	Date	10/01/2011	
Federal fiscal year end date for installed DRG version	Date	09/30/2012	
Interim claim minimum length	Numeric	30	Only interim claims with a length of stay greater than 30 will be payable.
Administrative day level 1 per diem – this is the current administrative days per diem	Numeric, dollar amount	Not yet determined	One value will exist for all providers. Value can be stored as a system parameter or stored by provider / revenue code combination in the provider master file as done today.

Table 7.2.1 New System Parameters and Lists			
Parameter	Format	Tentative Initial Value	Notes
Administrative day level 2 per diem	Numeric, dollar amount	Not yet determined	One value will exist for all providers. Value can be stored as a system parameter or stored by provider / revenue code combination in the provider master file as done today for the administrative day per diem.
Rehabilitation per diem	Numeric, dollar amount	Not yet determined	One value will exist for all providers. Value can be stored as a system parameter or stored by provider / revenue code combination in the provider master file similar to the way per diems are stored today.
<b>System lists – multiple values</b>			
DRG transfer status codes	Character string	"02", "05", "65", "66"	
Rehab APR-DRGs	Character string	"860-1", "860-2", "860-3", "860-4"	
Rehab revenue codes	Character string	"118", "128", "138", "148", "158"	
Manual HCAC Categories Pediatric	Character string	02, 06, 07, 08	02 = Air Embolism 06 = Catheter Associated Urinary Tract Infection 07 = Vascular Catheter Associated Infection 08 = Surgical Site Infection

## BR-Ref-2: Define new adjudication edits

Many new claim adjudication edits are required to support DRG pricing. Those edits are described in detail in the section of this document called “Adjudication Edits.” Each of these new edits will need to be defined within the Reference sub-system. Generally, definition of an edit involves assigning an edit number, deciding on the description for the edit, mapping the edit to a standard 835 electronic remittance advice adjustment reason code, setting the edit disposition (suspend, super-suspend, deny, etc.), and detailing instructions for working the edits within suspense correction.

## BR-Ref-3: View/update new reference DRG pricing file online

A new Reference DRG pricing file needs to be added to support DRG pricing. This file will need to be viewable and updateable to users who support CA-MMIS reference data. The fields in the file are shown in the following table.

Column	Format	Validation
DRG_Code	PIC X(05)	Cannot be blank
Eff_Begin_Dt	Standard CA-MMIS date format	Must be a valid date Also no two rows should be allowed to have overlapping effective dates for the same DRG code.
Eff_End_Dt	Standard CA-MMIS date format	Must be a valid date and must be equal to or greater than the begin date. Also no two rows should be allowed to have overlapping effective dates for the same DRG code.
DRG_Description	PIC X(100)	Cannot be blank
DRG_ALOS	PIC 9(03).9(02)	Must be numeric. A value of zero is only acceptable for DRG values “955-0” and “956-0”.
DRG_Casemix_Rel_Wt	PIC 9(03).9(04)	Must be numeric. A value of zero is only acceptable for DRG values “955-0” and “956-0”.
DRG_Svc_Adjstr_All_Others	PIC 9(03).9(02)	Must be numeric. A value of zero is NOT acceptable. The default value for this field will be 1.00.
DRG_Svc_Adjstr_Desig_NICU	PIC 9(03).9(02)	Must be numeric. A value of zero is NOT acceptable. The default value for this field will be 1.00.
DRG_Age_Adjstr	PIC 9(03).9(02)	Must be numeric. A value of zero is NOT acceptable. The default value for this field will be 1.00.
Mcaid_Care_Categ_Adult	PIC X(50)	Cannot be blank
Mcaid_Care_Categ_Child	PIC X(50)	Cannot be blank
DRG_On_Review_Ind	PIC X(01)	Valid values will be “Y” and “N”.

## BR-Ref-4: Batch update process for DRG pricing file

A batch update process will need to be created to load the DRG pricing file. The process should support adds of new rows, changes of existing rows based on a key of DRG code and effective-begin-date, and deletes of existing rows, also based on a key of DRG code and effective-begin-date. The batch load should produce two output reports – one describing what records changed, and another, describing input records rejected with a data error.

Please see the Table 7.2.2 for validations that need to occur in the batch load.

## 7.3 Provider Master File

### BR-Prov-1: Allow new fields to be viewable and updateable

A few new fields will need to be added to the provider master file to support DRG pricing. Some of these fields may already exist within the provider master file. If they do, no changes are needed. If they do not, then they will need to be added either to an existing file or to a new file. And logic will need to be added to make the new fields viewable and updateable by users. All of these fields are date sensitive. The fields are shown in Table 7.3.1.

Table 7.3.1 Edits for Updates to Provider-Specific Fields Supporting DRG Pricing		
Column	Format	Validation
Inpatient payment method	PIC X(1)	Valid values could be "P" for per diem pricing and "D" for DRG pricing. Other values may also be needed to identify other pricing methods. For most providers of type 016 and 060, this value will be "D" for dates after the cut-over to DRG pricing. However, the value will be "P" for designated public hospitals as they will continue to be paid via a per diem method. Possibly the contract/non-contract indicator could be used for this field.
Cost-to-charge ratio	PIC 9(1)V9(05)	For a provider being paid via DRGs, this value cannot be zero.
DRG base price	PIC 9(09)V9(02)	For a provider being paid via DRGs, this value cannot be zero.
Per-claim add-on payment	PIC 9(09)V9(02)	This field must contain a numeric value. \$0.00 is a valid value. All providers are expected to have an initial value of \$0.00.
Designated NICU indicator	PIC X(1)	Value must be "Y" or "N".  Note: it's possible an indicator already exists in the provider master file for this value.

If these fields need to be added to a new file, the key to the file will be provider number and effective-begin-date.

## BR-Prov-2: Batch update for new fields supporting DRG pricing

A batch update process will need to be created to load the new provider master file fields needed to support DRG pricing. If these fields are added to a brand new file, then the batch load process should support adds of new rows, changes of existing rows based on a key of provider number and effective-begin-date, and deletes of existing rows, also based on a key of provider number and effective-begin-date. If these fields are added to an existing file, then the batch load process can be much simpler and will support changes to these values. The values will be date sensitive and only one set of values should be in effect on any single day.

The batch load should produce two output reports – one describing what records changed, and another, describing input records rejected with a data error.

Please see Table 7.3.1 for validations that need to occur in the batch load.

## 7.4 TAR Data Entry – SURGE and SAR

The changes to Treatment Authorization Request (TAR) requirements will apply to both regular Medi-Cal fee-for-service, GHPP, and CCS beneficiaries. Thus, the TAR entry requirements identified below will apply to both the Service Utilization Review Guidance and Evaluation system (SURGE) and the Service Authorization Request system (SAR).

### BR-TAR-1: TAR only admit on most inpatient stays

With the implementation of DRG pricing, most inpatient stays will require a TAR only for the admission. TARs will no longer need to specify the number of days authorized. The specific business requirements for changes to TAR editing are listed under requirement “BR-Adj-Edit-7: TAR Edits within Claims Adjudication.” These requirements apply both to TAR data entry and TAR edits on claims, as these two processes work in concert.

# 7.5 Inpatient Claim Data Entry

## BR-Clm-Entry-1: Capture additional fields on inpatient claims

Additional data fields from incoming inpatient claims must be captured to support DRG pricing. Those fields are:

- 25 claim header diagnosis codes
- 25 present-on-admission indicators (associated with the diagnosis codes)
- 25 surgical procedure codes
- 25 surgical procedure dates (associated with the procedure codes)
- 6 external cause of injury diagnosis codes (form locator 72 on the UB-04 paper claim form)
- 4 occurrence codes (form locators 31, 32, 33, and 34 on the UB-04 paper claim form)

These fields need to be captured on all inpatient claims, whether submitted electronically (837I) or on paper (UB-04). **Note:** on paper claims, some of these fields have fewer instances.

Only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic. The dates associated with the occurrence code values will not be needed.

This data must be easily accessible to the inpatient claims pricing process performed within claims adjudication using CCN as the primary key. Once a claim has been paid, the record for that claim can be moved to a historical file that is less easily accessible. However, the claim adjustment process must be able to retrieve these fields when making a new copy of a claim. In addition, the fields will need to be accessible for extracts to data warehouses and accessible for standard claim audits.

Requirements for capture of additional fields on inpatient claims are also described in requirements BR-Pricing-2 and BR-DB-3.

# 7.6 Adjudication Edits

## BR-Adj-Edit-1: Pricing method edit

Nearly all the new edits described in this section apply only to claims that will be priced via DRGs. So one of the first steps in the adjudication of an inpatient claim will need to be determination of whether or not the claim will price via the new DRG methodology. And edits need to be defined to catch the unlikely scenario of being unable to determine how the claim will price. Those two edits are shown in Table 7.6.1 and should apply to all inpatient and Medicare Part A crossover claims in which the provider type is 016 or 060.

Table 7.6.1 Inpatient Pricing Method Claim Exceptions				
Edit #	Description	Draft Disposition	Logic	Notes
A	Provider inpatient payment method not found	Super-suspend claim	This edit will post if the inpatient payment method indicator on the provider master file is blank or contains an invalid value.	
B	APR-DRG cutover date not found	Super-suspend claim	This edit will post if the APR-DRG pricing cutover date in the system parameter table is missing or blank or zero	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".

## BR-Adj-Edit-2: Inpatient claim data validity edits

This section describes edits of basic inpatient claim data that must be valid to price a claim under a DRG methodology. These edits should apply to inpatient claims pricing via DRGs, but not to Medicare Part A crossover claims.

Table 7.6.2 Inpatient Claim Data Validity Exceptions				
Edit #	Description	Draft Disposition	Logic	Notes
C	Rehabilitation revenue code system list not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and the rehabilitation revenue code system list not found	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
D	Invalid mix of services on the same inpatient claim.	Deny claim	<p>This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and revenue codes are found on the claim line items for more than one of the following 4 categories of service.</p> <p>The 4 categories of service are:</p> <ol style="list-style-type: none"> <li>1. Administrative day level 1 – identified by revenue code 169.</li> <li>2. Administrative day level 2 – identified by revenue code 199.</li> <li>3. Rehab service – identified by revenue codes 118, 128, 138, 148, and 158</li> <li>4. Acute care accommodation code – all values between 100 and 219 except 118, 128, 138, 148, 158, 169, and 199. Also includes all values between 710 and 729.</li> </ol> <p>Claims price differently under each of these categories, so any claim with revenue codes from more than one of these categories cannot be priced and needs to be denied.</p>	If there is already a specific purpose for revenue code 199 within Medi-Cal billing instructions, then a different revenue code for administrative day level 2 will need to be selected.
E	Invalid type of bill	Deny claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and the type of bill on the claim is invalid. Valid types of bill are available in the UB-04 billing manual	There may already be an SDN adding this edit to CA-MMIS.

Table 7.6.2

## Inpatient Claim Data Validity Exceptions

Edit #	Description	Draft Disposition	Logic	Notes
F	Late charges are not billable	Deny claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and the type of bill equals 115	This could be included as part of the valid type of bill edit
G	Patient discharge status and bill type mismatch	Deny claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and 1. (The type of bill is 112 or 113) AND (discharge status is not 30) OR 2. (Type of bill is 111 or 114) AND (discharge status is 30)	
H	Interim claim minimum length of stay not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and the interim claim minimum length of stay value in the system parameter table is missing or blank or zero	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
I	Interim claim too short length of stay	Deny claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and the discharge status is 30 and the length of stay is less than or equal to the length of stay threshold for interim claims, and "A3" was NOT billed as one of the occurrence codes. That minimum length of stay threshold will be stored as a new system parameter.	The current plan is to set the interim claim length of stay threshold to 30 days. So only interim claims with length of stay greater than 30 days will be payable.
J	Services for mother and newborn not billable on the same claim	Deny claim	This edit will post if the provider is configured to price via DRGs (provider inpatient pricing method code is "DRG") and a revenue code in the set of 112, 122, 132, 152, and a revenue code in the range of 170 – 179 are billed on different lines on the same claim.	

## BR-Adj-Edit-3: HCAC and erroneous surgery edits

The Center for Medicare and Medicaid Services (CMS) has come out with a new directive requiring Medicaid programs to avoid paying for health care-acquired conditions (HCACs) and erroneous surgeries. Because DRG pricing is one of the easiest methods for avoiding payment for HCACs, the requirements for meeting CMS' HCAC mandate are being included with this DRG SDN. One of those requirements is to add a few adjudication edits to CA-MMIS. These edits should post on all inpatient and Medicare Part A crossover claims in which the provider type is 016 or 060.

Edit #	Description	Draft Disposition	Logic	Notes
K	POA indicator invalid	Deny claim	This edit will post when the present-on-admission indicator is invalid for any diagnosis on the claim. Effective with the implementation of EDI 5010, the valid values for POA will be:  Y – Yes N – No U – Unknown, incomplete documentation W – Clinically unclear Blank – exempt from POA reporting	Applicable only for primary and secondary diagnoses, not external cause of injury diagnoses and not admit diagnosis
L	Erroneous surgery performed	Suspend claim	This edit will post if diagnosis code E876.5, E876.6, or E876.7 is found as a principal diagnosis, secondary diagnosis or external cause of injury diagnosis	Related to new law which also included requirement for Medicaid to avoid payment for HCACs
M	Identify claims with a HCAC, but no change in DRG	Pay and report	This edit will post when the HCAC utility identifies a health care-acquired condition (HCAC) on the claim, but the HCAC did not cause a change in the DRG (pre-HCAC DRG and post-HCAC DRG are the same).	Could be an indicator added to the claim instead of an edit
N	Identify claims with a HCAC and change in the DRG	Pay and report	This edit will post when the HCAC utility identifies a health care-acquired condition (HCAC) on the claim, and the HCAC caused a change in the DRG (pre-DRG and post-HCAC DRG are different)	Could be an indicator added to the claim instead of an edit

## BR-Adj-Edit-4: DRG pricing parameter edits

Table 7.6.4 lists edits that should post if configuration fields needed to price via DRGs cannot be found. These edits are expected to get a disposition of super-suspend because they are all an indication that some configuration data has not been loaded correctly in CA-MMIS. A claim should never deny for any of these edits. Instead, when these post, the appropriate configuration data should be loaded. Most of these edits should apply to inpatient and Medicare Part A crossover claims for which the provider is configured to price using DRG pricing. There are a few exceptions and those are mentioned in the Logic column.

Table 7.6.4 Inpatient Claim DRG Pricing Parameter Exceptions				
Edit #	Description	Draft Disposition	Logic	Notes
O	DRG base price not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the DRG base price on the provider master file is missing, blank, zero, or non-numeric.	
P	Provider cost-to-charge ratio not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the cost-to-charge ratio for the provider is missing, blank, zero, or non-numeric.	
Q	DRG age threshold not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and DRG age in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
R	DRG provider loss outlier threshold 1 not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and DRG provider loss outlier threshold 1 in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
S	DRG provider loss outlier threshold 2 not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and DRG provider loss outlier threshold 2 in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
T	DRG casemix adjustment factor not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the DRG casemix adjustment factor in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
U	DRG provider gain outlier threshold not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the DRG provider gain outlier threshold in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".

Table 7.6.4

## Inpatient Claim DRG Pricing Parameter Exceptions

Edit #	Description	Draft Disposition	Logic	Notes
V	DRG marginal cost percent 1 is not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and DRG marginal cost percent 1 in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
W	DRG marginal cost percent 2 is not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and DRG marginal cost percent 2 in the system parameter table is missing, blank, zero, or non-numeric.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
X	DRG transfer status code list is not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the DRG transfer code system list is not found.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
Y	Manual HCAC category list not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs and the manual HCAC category system list is not found.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
Z	Installed DRG version parameter not found	Super-suspend claim	This edit will post if the provider type is 016 or 060 and the installed DRG version system parameter is not found or is blank.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
AA	DRG fiscal year begin date parameter not found	Super-suspend claim	This edit will post if the provider is 016 or 060 and the installed DRG grouper fiscal year begin date system parameter is not found or is blank or is not a valid date.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
AB	DRG fiscal year end date parameter not found	Super-suspend claim	This edit will post if the provider is 016 or 060 and the installed DRG grouper fiscal year end date system parameter is not found or is blank or is not a valid date.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
AC	Rehab DRG system list is not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs, the claim is inpatient (not inpatient crossover) and the rehabilitation DRG system list is not found.	This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".

Table 7.6.4

## Inpatient Claim DRG Pricing Parameter Exceptions

Edit #	Description	Draft Disposition	Logic	Notes
AD	Administrative day level 1 per diem not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs, the claim is for admin level 1 days, and the admin day level 1 per diem system parameter is missing, blank, zero, or non-numeric..	This edit is needed only if a decision is made to store the admin day level 1 per diem as a system parameter.  This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
AE	Administrative day level 2 per diem not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs, the claim is for admin level 2 days, and the admin day level 2 per diem system parameter is missing, blank, zero, or non-numeric..	This edit is needed only if a decision is made to store the admin day level 2 per diem as a system parameter.  This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".
AF	Rehabilitation per diem not found	Super-suspend claim	This edit will post if the provider is configured to price via DRGs, the claim is for rehab services, and the rehab per diem system parameter is missing, blank, zero, or non-numeric..	This edit is needed only if a decision is made to store the rehabilitation per diem as a system parameter.  This can be a new edit, or could be an existing generic edit that simply says, "system parameter not found".

## BR-Adj-Edit-5: DRG grouping edits

There are a series of edits performed by the DRG grouper and when triggered will cause a non-zero value to be sent back in the return code. These non-zero return codes will need to be translated into CA-MMIS error codes. The mapping of non-zero return codes to CA-MMIS edits is shown in Table 7.6.5. These edits should apply to inpatient claims for providers with provider type 016 or 060, but not to Medicare Part A crossover claims. If a DRG cannot be determined for a Medicare Part A crossover claim, then the claim can simply pay the sum of Medicare coinsurance and deductible.

Edit #	Description	Draft Disposition	Logic	Notes
AG	ICD code mapping error	Super-suspend	This edit will post if the claim is going to price via DRGs and the ICD code mapping software sends back a non-zero return code.	This is not really a DRG grouping error, but has been included in the DRG grouping category of edits as the ICD code mapping is only performed to enable accurate DRG grouping. Mapping errors are extremely rare and generally are an indication that the mapping software is not installed correctly. That is why the draft disposition for this edit is super suspend.
AH	Invalid principal diagnosis code	Deny claim	This edit will post if the claim is going to price via DRGs and the APR-DRG assigned to the claim is 955-0 or the DRG grouper return code is 1.	
AI	Valid DRG code could not be determined	Deny claim	This edit will post if the claim is going to price via DRGs and the APR-DRG assigned to the claim is 956-0 and the return code is zero, or the return code is 2, or the return code is 11, or the return code is non-zero and there is no mapping of the return code to a DRG specific edit.	
AJ	DRG invalid beneficiary age	Deny claim	This edit will post if the claim is going to price via DRGs and the return code from the grouper is 3 or 9.	
AK	DRG invalid beneficiary gender	Deny claim	This edit will post if the claim is going to price via DRGs and the return code from the grouper is 4.	
AL	DRG invalid discharge status	Deny claim	This edit will post if the claim is going to price via DRGs and the return code from the grouper is 5.	
AM	DRG invalid birth weight	Deny claim	This edit will post if the claim is going to price via DRGs and the return code from the grouper is 6.	
AN	DRG gestational age and birth weight conflict	Deny claim	This edit will post if the claim is going to price via DRGs and the return code from the grouper is 12.	

## BR-Adj-Edit-6: Post DRG grouping edits

Four new edits need to be performed after the DRG is assigned to the claim. These edits are shown in Table 7.6.6 and should apply to inpatient claims for providers with type 016 and 060, but not to Medicare Part A crossover claims. If a DRG cannot be determined for a Medicare Part A crossover claim, then the claim can simply pay the sum of Medicare coinsurance and deductible.

Table 7.6.6 Inpatient Claim Post DRG Grouping Exceptions				
Edit #	Description	Draft Disposition	Logic	Notes
AO	Rehab claim without rehab revenue code	Deny claim	Post if the claim groups to a rehab APR-DRG (stored in a system list) and does not contain a rehab revenue code (also stored in a system list).	Current plan is that the rehab APR-DRGs will be 860-1, 860-2, 860-3, and 860-4, and the list of rehab revenue codes is 118, 128, 138, 148, and 158. Both the rehab DRGs and the rehab revenue codes will be stored in system lists.
AP	DRG not on file	Super-suspend claim	This edit will post if the claim is going to price via DRGs and the DRG returned from the grouper is not found in the Reference DRG pricing file.	
AQ	DRG on review	Suspend	This edit will post if the claim is going to price via DRGs and the on-review indicator for the DRG is set to "yes".	
AR	DRG relative weight missing	Super-suspend	This edit will post if the claims is going to price via DRGs, and the DRG codes is NOT equal to "955-0" and NOT equal to "956-0" and any of the following fields are blank, zero, or non-numeric: DRG_Casemix_Rel_Wt DRG_Svc_Adjstr_All_Others DRG_Svc_Adjstr_Desig_NICU DRG_Age_Adjstr	
<p>Note: Two other edits that must be performed after DRG grouping are related to health care-acquired conditions (HCACs) and are listed in Table 7.6.3.</p>				

## BR-Adj-Edit-7: TAR edits within claims adjudication

Today a TAR is required for each day of every inpatient hospital stay except those for vaginal deliveries with length of stay less than 3 days and cesarean deliveries with length of stay less than 5 days. When DRG pricing is implemented, most inpatient stays will only require a TAR for the admission, not for each individual day the beneficiary is in the hospital. However, there will be a variety of exceptions to this rule. For each exception the existing TAR process will apply, which, in most or all cases, involves a TAR for each day of a hospital stay. The specific exceptions to this change requiring a TAR only on the admission are listed below.

1. Providers that are not being paid under the DRG method will continue their current daily TAR process. This includes designated public hospitals, stand-alone psychiatric hospitals, stand-alone rehabilitation hospitals, and hospice providers. (An indicator will be stored on the provider master file identifying those providers paid via DRGs.)
2. Some services will not be paid via DRGs even if they are performed at a general acute care facility in which most services will be paid via DRGs. These services include administrative day level 1, administrative day level 2, and rehabilitation. For these services, the existing process including daily TARs will continue to be required. Claims for level 1 administrative day will be identified by the presence of revenue code 169. Claims for level 2 administrative day will be identified by the presence of revenue code 199. Claims for rehabilitation services will be identified by the presence of revenue code 118, 128, 138, 148, and/or 158.
3. Claims for beneficiaries with restricted benefit aid codes will continue to require daily TARs if the hospital stay is unrelated to delivery of a baby. Claims for these beneficiaries need a daily TAR because Federal Financial Participation rules require no payment for procedures that are non-emergency. A daily audit through the TAR process is needed to ensure only emergency services get reimbursed. Claims with restricted benefit aid codes will be identified as any claim assigned a beneficiary benefit aid code whose description is not "Full" or "Full benefits".
4. Obstetric admissions for the delivery of a baby will not require any authorization. This is similar to current TAR rules. However, under current TAR rules obstetric admissions including induction that start the day before a baby is born and unusually long obstetric stays (greater than 2 days for a vaginal delivery and greater than 4 days for a cesarean section delivery) required a TAR. For facilities being priced using DRGs, no obstetric admissions for the delivery of a baby will require any authorization.

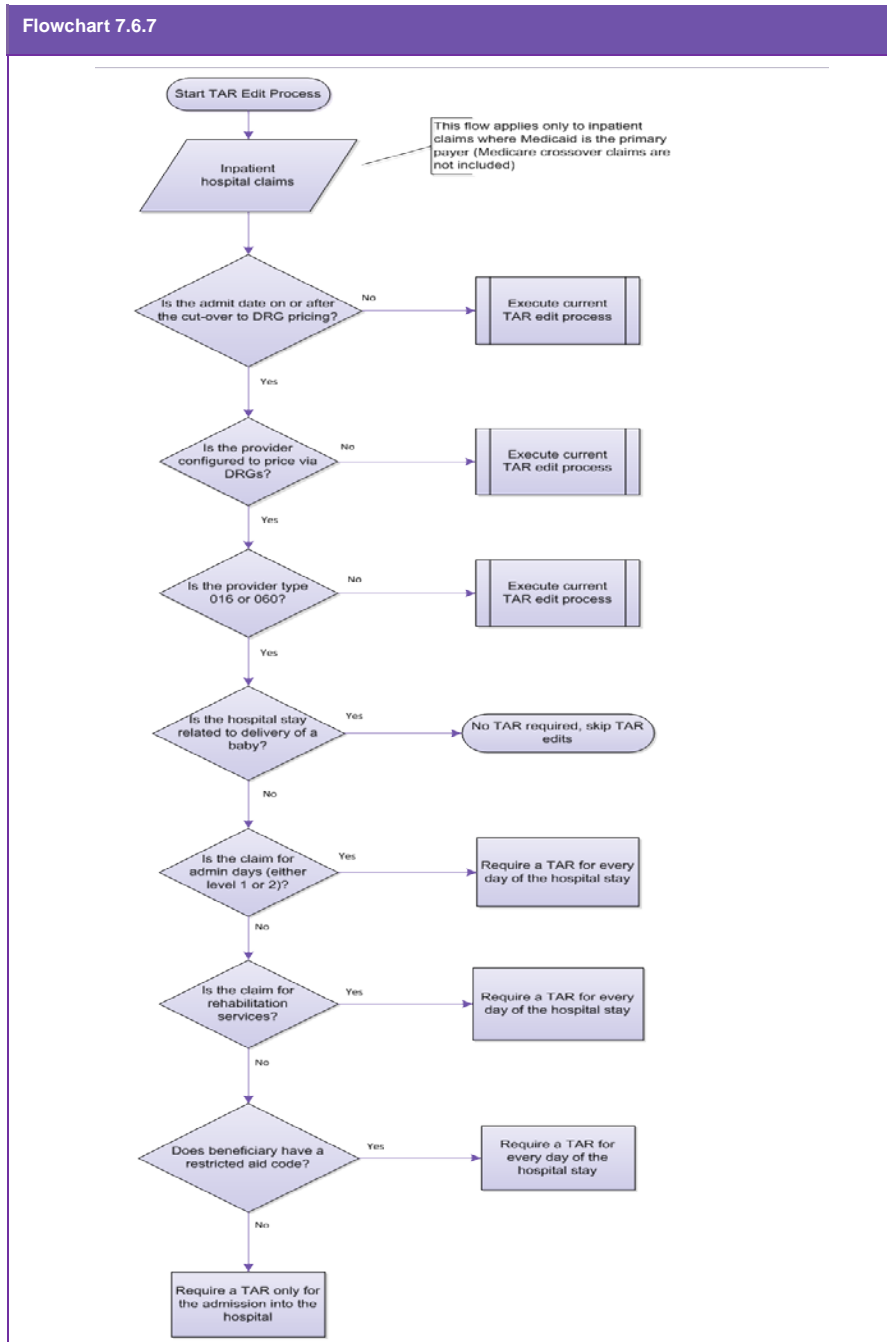

A summary of the TAR requirements for inpatient claims is shown Table 7.6.7.

Table 7.6.7

## TAR Entry Business Requirements for Inpatient Claims after DRG Pricing is Implemented

Type of Stay	TAR Approach Current	TAR Approach New	Paid under DRGs
<b>General Acute Care</b>			
General acute care inpatient stay – complete stay	TAR every day	<b>TAR admission only</b>	Yes
General acute care inpatient stay – interim claim	TAR every day	<b>TAR admission only</b>	No, paid per diem (until final claim is submitted)
<b>Obstetrics (OB)</b>			
OB admission	No TAR required	No TAR required	Yes
OB with induction day before delivery	TAR every day	<b>No TAR required</b>	Yes
OB prolonged stays- vaginal 2 days; c-sect 4 days	TAR every day	<b>No TAR required</b>	Yes
<b>Other</b>			
Designated Public Hospitals	Separate process	Continue separate process	No
Administrative day level 1	TAR every day	TAR every day	No
Administrative day level 2 (currently referred to as subacute)	TAR every day	TAR every day	No
Beneficiaries with restricted aid codes admitted for non-OB services	TAR every day, including review to ensure all services are emergency services	No change; TAR every day, including review to ensure all services are emergency services	Yes, process modified to avoid paying for non-emergency surgeries
CCS and GHPP beneficiaries	TAR every day	<b>TAR admission only</b>	Yes
Rehabilitation stays	TAR every day	TAR every day	No
Stays at psychiatric facilities	TAR every day	TAR every day	No
Medicare crossover claims – Medicare is primary payer	No	No	Medicaid amount calculated through DRG pricing before crossover comparison pricing
Hospice care	TAR every day	TAR every day	No
<i>Notes:</i>			
1 The SAR system is a DHCS-supported system and system modifications are the responsibility of DHCS staff.			
2 Outliers will be monitored using an analytical oversight process. DHCS may decide to focus TAR review for outliers as the findings indicate.			

These TAR requirements are also depicted in the following flowchart 7.6.7.

The logic for editing the claim against the specifics of the TAR will be as shown in Table 7.6.8 and should apply to inpatient claims pricing via DRGs, but not to Medicare Part A crossover claims. For these claims a TAR not on file edit should also be executed. This is undoubtedly an existing edit within CA-MMIS and matches the TAR number the provider ID and the beneficiary ID on the claim against TARs in the TAR file.

Table 7.6.8 Inpatient Claim TAR Exceptions				
Edit #	Description	Draft Disposition	Logic	Notes
AS	Date of admission not covered within the dates of service on the TAR	Deny claim	This edit will post if: <ul style="list-style-type: none"> <li>• The claim is going to price via DRGs and</li> <li>• The beneficiary has full benefits (as defined by the benefit aid code) and</li> <li>• The claim is not for delivery of a baby and</li> <li>• The date of admission on the claim is outside the dates of service on the TAR.</li> </ul>	The list of diagnosis codes used to identify delivery stays already exists in CA-MMIS and is shown in Table 7.6.9.

Table 7.6.9 shows a tentative list of the procedure and diagnosis codes used to identify delivery hospital stays.

Table 7.6.9 Procedure and Diagnosis Codes Identifying Delivery Stays			
Omit Diagnostic Code ID	Admitting Procedure / Diagnosis Code	Description	Vaginal / Cesarean Indicator
<b>Procedure Codes</b>			
1	72	Forceps, vacuum, and breech delivery	1
2	72.0	Low forceps operation	1
3	72.1	Low forceps operation with episiotomy	1
4	72.2	Mid forceps operation	1
5	72.21	Mid forceps operation with episiotomy	1
6	72.29	Other mid forceps operation	1
7	72.3	High forceps operation	1
8	72.31	High forceps operation with episiotomy	1
9	72.39	Other high forceps operation	1
10	72.4	Forceps rotation of fetal head	1
11	72.5	Breech extraction	1
12	72.51	Partial breech extraction with forceps to aftercoming head	1
13	72.52	Other partial breech extraction	1
14	72.53	Total breech extraction with forceps to aftercoming head	1
15	72.54	Other total breech extraction	1
16	72.6	Forceps application to aftercoming head	1
17	72.7	Vacuum extraction	1
18	72.71	Vacuum extraction with episiotomy	1
19	72.79	Other vacuum extraction	1
20	72.8	Other specified instrumental delivery	1
21	72.9	Unspecified instrumental delivery	1
22	73	Other procedures inducing or assisting delivery	1
23	73.0	Artificial rupture of membranes	1
24	73.01	Induction of labor by artificial rupture of membranes	1
25	73.09	Other artificial rupture of membranes	1
26	73.1	Other surgical induction of labor	1
27	73.2	Internal and combined version and extraction	1
28	73.21	Internal and combined version without extraction	1
29	73.22	Internal and combined version with extraction	1
30	73.3	Failed forceps	1
31	73.4	Medical induction of labor	1
32	73.5	Manually assisted delivery	1
33	73.51	Manually rotation of fetal head	1

## Procedure and Diagnosis Codes Identifying Delivery Stays

Omit Diagnostic Code ID	Admitting Procedure / Diagnosis Code	Description	Vaginal / Cesarean Indicator
34	73.59	Other manually assisted delivery	1
35	73.6	Episiotomy	1
36	73.8	Operations on fetus to facilitate delivery	1
37	73.9	Other operations assisting delivery	1
38	73.91	External version	1
39	73.92	Replacement of prolapsed umbilical cord	1
40	73.93	Incision of cervix to assist delivery	1
41	73.94	Pubiotomy to assist delivery	1
42	73.99	Other	1
43	74	Cesarean section and removal of fetus	2
44	74.0	Classical cesarean section	2
45	74.1	Low cervical cesarean section	2
46	74.2	Extraperitoneal cesarean section	2
47	74.3	Removal of extratubal ectopic pregnancy	2
48	74.4	Cesarean section of other specified type	2
49	74.99	Other cesarean section of unspecified type	2
50	650	Normal delivery	1
<b>Diagnosis Codes</b>			
51	V30.00	Single lb-in hosp	1
52	V30.01	Single lb-in hosp	1
53	V31.01	Single lb-in hosp	1
54	669.71	Cesarean	2
55	644.13	Threat labor	2
56	644.03	Threat prenat labor	2
<i>Note: This list is intended to match Table 1806 currently used in CA-MMIS. If there are any differences between this list and the one currently defined in CA-MMIS please assume the list in CA-MMIS is correct.</i>			

# 7.7 Claims Pricing

## BR-Pricing-1: Add branching logic

Branching logic will need to be added to ensure claims price under appropriate methods. After implementation of DRG pricing, most inpatient claims, but not all, will price via the DRG method. Some claims will continue to price under their current method and others will price under new methods that will take effect only after DRG pricing is implemented. So logic will need to be added to ensure claims flow down the appropriate path of logic in order to be priced correctly. Table 7.7.1 shows the different scenarios and the pricing method that will apply under each scenario. These scenarios only apply to claims from providers whose provider type is 016 or 060.

Table 7.7.1 Pricing Methods for Types of Inpatient Claims		
Scenario	How Identified	Pricing Method
Claim admit date is prior to cutover to DRG pricing	Claim admit date is less than the DRG pricing cutover date stored in a system parameter	Current pricing method
For all the following scenarios, the admit date on the claim is on or after the DRG pricing cut-over date		
Provider is a designated public hospital or stand-alone psychiatric facility	The new payment method indicator field stored on each provider record will be a value other than "DRG" for designated public hospitals.	Current pricing method (DRG pricing will not be used for designated public hospitals)
Claim is for administrative days, level 1 or 2	Claim contains revenue code 169 or 199	Current pricing method including per diem payment for revenue code 169 or 199 and separate payment for ancillary services. Administrative day level 2 claims will receive a different per diem than level 1 claims, but will otherwise price the same as level 1 including payment for select ancillary services.
Claim is for rehabilitation services	Claim contains revenue code 118, 128, 138, 148, and/or 158	Claim will price under a per diem payment method with the per diem applied only to service lines with revenue code 118, 128, 138, 148, or 158. No other revenue codes on the claim will be payable on rehab claims.
Interim stay claim	Patient discharge status is 30 and occurrence code "A3" is NOT on the claim.	Claim will price under a per diem payment method with the per diem multiplied by the length of stay including the date of discharge as one of the days. If occurrence code "A3" is on the claim, the beneficiary did not have Medi-Cal fee-for-service eligibility at the end of the hospital stay. In this case, the claim will be priced via the DRG and will go through the partial eligibility logic.
All other scenarios	None of the above scenarios hit	Claim will price under the new DRG pricing method.
<b>Notes:</b> <ol style="list-style-type: none"> <li>1 These scenarios only apply to claims from providers whose provider type is 016 or 060.</li> <li>2 A new edit will be added to deny any claim that falls into more than one pricing category, where the pricing categories are: DRG, administrative day level 1, administrative day level 2, and rehabilitation (Table 7.6.2).</li> </ol>		

## BR-Pricing-2: Retrieve additional claim data for DRG pricing

Additional claim data submitted by providers and needed for DRG pricing will be stored in a file separate from the claim activity file/record. This data will need to be retrieved in order to perform DRG pricing. The data includes:

- Up to 25 claim header diagnosis codes
- Up to 25 present-on-admission indicators (associated with the diagnosis codes)
- Up to 25 surgical procedure codes
- Up to 25 surgical procedure dates (associated with the procedure codes)
- Up to 6 external cause of injury diagnosis codes (form locator 72 on the UB-04 paper claim form)
- Up to 4 occurrence codes (form locators 31, 32, 33, and 34 on the UB-04 paper claim form)

**Note:** On paper claims, some of these fields have fewer instances.

The external cause of injury diagnosis codes are not actually needed for DRG pricing. They are only needed for the new erroneous surgery edit. It may make sense to retrieve these diagnosis codes during claim pricing and perform the erroneous surgery edit in claim pricing, but it would certainly also be acceptable to retrieve this data and perform this edit elsewhere within the adjudication cycle.

Also, only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic. The dates associated with the occurrence code values will not be needed.

The current expectation is that this additional claim data will be stored and retrieved much the same way the electronic remittance advice (835) process under EDI 5010 will retrieve fields from the 837I to populate the 835.

## BR-Pricing-3: Add call to diagnosis/procedure code mapper

A call to a mainframe-based third-party software application called the diagnosis and procedure code mapper will need to be added. This software is written by 3M. If the software sends back a non-zero return code, an MMIS edit should post to the claim, as mentioned in Table 7.6.5.

The ICD mapping software only needs to be called if the admit date on the claim is outside of the federal fiscal year recognized by the DRG grouper. For example, when DRG pricing is implemented the version of the DRG grouper that will be installed is version 29. Version 29 was released in federal fiscal year 2012, which starts on October 1, 2011 and ends on September 30, 2012. If the claim has an admit date in this federal fiscal year, the ICD mapping software does not need to be called. If on the other hand, the claim's admit date is outside this 12-month period (less than October 1, 2011 or greater than September 30, 2012), then the ICD mapping software does need to be called.

The begin and end dates of the federal fiscal year recognized by the installed version of the DRG grouper will be stored in system parameters to support the decision on whether or not the ICD mapping software needs to be called. And these system parameters will need to be updated each time a new version of the APR-DRG grouping software is installed.

## BR-Pricing-4: Build DRG grouping input record

The DRG grouping input record is used in both the call to the health care-acquired condition (HCAC) utility and to the DRG grouper. The list of fields included in the DRG grouper input record is shown in Table 7.7.2.

Table 7.7.2 Input to DRG Grouper
CCN
First date of service
Last date of service
Patient discharge status
Source of admission (optional)
Type of admission (optional)
Beneficiary gender
Beneficiary date of birth
Beneficiary age (not required if date of birth is given)
Admit diagnosis code
All diagnosis codes submitted on the claim
Present-on-admission indicators for each diagnosis code
All surgical procedure codes submitted on the claim
ICD version indicator

One exception to this list of fields exists for Medi-Cal. The exception is intended to avoid paying for non-emergency surgeries performed on beneficiaries who are eligible only for emergency services. Beneficiaries eligible only for emergency services will be identified using the beneficiary aid code. A tentative list of restricted benefit aid codes is provided in Table 7.7.3 and the list will need to be reviewed for completeness during the functional or technical design phases. For these beneficiaries, treatment authorization will continue to be performed on every day of each hospital stay as long as the stay is not related to delivery of a baby. This will allow CA-MMIS to know which days of the stay were authorized and which, if any, were not authorized. Surgeries performed on days that were not authorized should intentionally be kept out of the DRG grouping input record. Holding these surgeries out of the call to the DRG grouper will ensure they do not contribute to the assignment of a DRG code and, thus, do not contribute to payment on the claim. There will be some cases where a non-emergency and an emergency surgery are performed on the same day. In those cases, the day is expected to be authorized and both the non-emergency and the emergency surgery codes will be passed to the DRG grouper. These cases do risk getting overpaid, but the number of these cases is expected to be low, and decisions were made during requirements meetings with the Utilization Management Division that holding back surgeries based on days authorized was the most practical way to avoid paying for non-emergency services, even if not foolproof in all cases.

Table 7.7.3 Restricted Benefit Aid Codes		
Benefit Aid Code	Benefit Aid Cat Desc	Program Description
44	Restricted to pregnancy-related services	200 Percent FPL Pregnant (Income Disregard Program – Pregnant). Provided if below 200 percent of the FPL
48	Restricted to pregnancy-related services	200 Percent FPL Pregnant Omnibus Budget Reconciliation Act (OBRA) (Income Disregard Program – Pregnant OBRA).
50	Restricted to CMSP emergency services only	County Medical Services Program (CMSP). OBRA/Out of County Care.
53	Restricted to LTC and related services	Medically Indigent – Long Term Care (LTC) services. 21 or older and under 65 in Nursing Facility Level A or B.
55	Restricted to pregnancy and emergency services	OBRA Not PRUCOL – Long Term Care (LTC) services. Covers eligible undocumented aliens in LTC who are not PRUCOL.
58	Restricted to pregnancy and emergency services	OBRA Aliens. Covers eligible aliens who do not have satisfactory immigration status.
69	Restricted to emergency services	200 Percent Infant OBRA. Emergency services only for infants w/out satisfactory immigration status
71	Restricted to dialysis and supplemental dialysis-related services	Medi-Cal Dialysis Only Program/Medi-Cal Dialysis Supplement Program (DP/DSP).
73	Restricted to parenteral hyperalimentation-related expenses	Total Parenteral Nutrition (TPN). Covers Medically Needy or Medically Indigent Programs.
74	Restricted to emergency services	133 Percent Program (OBRA). Children without satisfactory immigration status.
76	Restricted to 60-day postpartum services	60-Day Postpartum Program.
77	Limited to organ transplant anti-rejection medication only	Organ transplants: anti-rejection medications program.
80	Restricted to Medicare expenses	Qualified Medicare Beneficiary (QMB). Provides premium payment for aged, blind or disabled individuals.
84	CMSP services only (no Medi-Cal)	MI – Adult. Covers medically indigent adults aged 21 and over but under 65.
85	CMSP services only (no Medi-Cal)	MI – Adult. Covers medically indigent adults aged 21 and over but under 65.
88	CMSP services only (no Medi-Cal)	MI – Adult – Disability Pending.
89	CMSP services only (no Medi-Cal)	MI – Adult – Disability Pending SOC.
0C	HF services only (no Medi-Cal)	Access for Infants and Mothers (AIM) – Infants enrolled in Healthy Families (HF)
0L	Restricted	Breast and Cervical Cancer Treatment Program (BCCTP) Transitional Coverage Until Determination of Eligibility

Table 7.7.3 Restricted Benefit Aid Codes		
Benefit Aid Code	Benefit Aid Cat Desc	Program Description
0R	Restricted Services	BCCTP – High Cost Other Health Coverage (OHC). State-funded. Payment for non-covered cancer-related services.
0T	Restricted Services	BCCTP – State-Funded. 18 mo. breast cancer and 24 mo. cervical cancer treatments for males and females 65 or older.
0U	Restricted Services	BCCTP – Undocumented Aliens. Younger than 65 with unsatisfactory immigration status w/breast and/or cervical cancer.
0V	Restricted Services	Post-BCCTP. Limited services for females younger than 65 with unsatisfactory immigration status w/out insurance
0X	Restricted	BCCTP Transitional Coverage. Covers former aid code 0U w/out satisfactory immigration.
0Y	Restricted	BCCTP Transitional Coverage. Covers former aid code 0U w/out satisfactory immigration, reached 65.
1U	Restricted to pregnancy and emergency services	Restricted Federal Poverty Level – Aged. Aged and Disabled FPL program w/out satisfactory immigration status.
3T	Restricted to pregnancy and emergency services	Initial Transitional Medi-Cal (TMC). Six mo. of coverage for aliens w/out satisfactory status discont. from Section 1931(b).
3V	Restricted to pregnancy and emergency services	AFDC – 1931(b) Non CalWORKS. Covers those eligible for the Section 1931(b) program.
5F	Restricted to pregnancy and emergency services	OBRA Alien – Pregnant Woman. Covers eligible pregnant alien women who do not have satisfactory immigration status.
5J	Restricted to pregnancy-related and emergency services	SB 87 Pending Disability Program.
5R	Restricted to pregnancy-related and emergency services	SB 87 Pending Disability Program.
5T	Restricted to pregnancy and emergency services	Continuing TMC. Provides an additional six months for who received six months under aid code 3T.
5W	Restricted to pregnancy and emergency services	Four-Month Continuing Pregnancy and Emergency Services Only. Provides for aliens w/out satisfactory immigration status.
6S	Unknown	
6U	Restricted to pregnancy and emergency services	Restricted Federal Poverty Level – Disabled. Aged and Disabled FPL program w/out satisfactory immigration status.
7C	Restricted to pregnancy and emergency services	100 Percent OBRA Child. W/out satisfactory immigration status.
7F	Valid for pregnancy verification office visit	Presumptive Eligibility (PE) – Pregnancy Verification.
7G	Valid only for ambulatory prenatal care services	Presumptive Eligibility (PE) – Ambulatory Prenatal Care.
7H	Valid only for TB-related outpatient services	Tuberculosis (TB) Program. Covers eligible individuals who are TB-infected for TB-related outpatient services only.

Table 7.7.3 Restricted Benefit Aid Codes		
Benefit Aid Code	Benefit Aid Cat Desc	Program Description
7K	Restricted to pregnancy and emergency services	Continuous Eligibility for Children (CEC). Children w/out satisfactory immigration status.
7M	Valid for Minor Consent services	Minor Consent Program. Covers eligible minors at least 12 years of age and under the age of 21.
7N	Valid for Minor Consent services	Minor Consent Program. Covers eligible pregnant minors under the age of 21.
7P	Valid for Minor Consent services	Minor Consent Program. Covers eligible minors at least 12 years of age and under the age of 21.
7R	Valid for Minor Consent services	Minor Consent Program. Covers eligible minors under age 12.
8F	CMSP acute inpatient services only	CMSP Companion Aid Code. Used in conjunction with Medi-Cal aid code 53.
8H	Family Planning	Family PACT (FPACT). Comprehensive family planning services for low income residents.
8N	Restricted to emergency services	133 Percent Excess Property Child – Emergency Services Only.
8T	Restricted to pregnancy and emergency services	100 Percent Excess Property Child – Pregnancy and Emergency Services Only.
8Y	CHDP services only	CHDP. Covers CHDP Children for emergency, pregnancy-related and Long Term Care (LTC) services.
9A	Cancer Detection Programs: Every Woman Counts only	The Cancer Detection Programs: Every Woman Counts beneficiary identifier.
9H	HF services only (no Medi-Cal)	Healthy Families Child.
C1	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C2	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C3	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C4	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C5	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C6	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C7	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C8	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
C9	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.

Table 7.7.3

Restricted Benefit Aid Codes

Benefit Aid Code	Benefit Aid Cat Desc	Program Description
D1	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens.
D2	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D3	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D4	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D5	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D6	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D7	Restricted to pregnancy and emergency services	OBRA Aliens – Not PRUCOL and Unverified Citizens – Long Term Care (LTC) services.
D8	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens – Pregnant Woman.
D9	Restricted to pregnancy and emergency services	OBRA Aliens and Unverified Citizens – Pregnant Woman.
E1	Restricted to pregnancy and emergency services	Unverified Citizens. Covers eligible unverified citizen children.

## BR-Pricing-5: Call health care-acquired condition (HCAC) utility

A call must be made to a mainframe based third party software application called the health care-acquired condition (HCAC) utility. This utility is also referred to as the hospital-acquired condition (HAC) utility. This utility will identify any diagnosis codes and/or diagnosis code / surgical procedure code combinations that are classified as health care-acquired conditions (HCACs). The utility also returns a separate list of diagnosis and surgical procedure codes intentionally missing those codes identified as HCACs.

## BR-Pricing-6: Add calls to DRG grouping software

Two calls to a mainframe-based third party software application written by 3M Health Information Systems called the APR-DRG grouper will need to be added. This software will assign the APR-DRG code. The first call should be performed using all the diagnosis and surgical procedure codes on the claim. The DRG assigned from this call is generally referred to as the pre-HCAC DRG. The second call should include only those diagnosis and surgical procedure codes that are not defined as HCACs. The 3M HCAC utility returns a list of all the diagnosis and surgical procedure codes on the claims except those defined as HCACs, making the removal of HCAC codes very easy. The DRG returned from the second call to the DRG grouper is generally referred to as the post-HCAC DRG.

On ninety percent (90%) or more of the claims, there will be no diagnosis or surgical procedure codes defined as HCACs. So it would be worthwhile to compare the list of codes sent to the HCAC utility against the list of codes returned from the HCAC utility. If the two lists are the same, then it is safe to assume the pre-HCAC and post-HCAC DRGs will be the same, and the second call to the DRG grouper can be skipped. Even in cases where there are codes defined as HCACs, the pre-HCAC and post-HCAC DRG codes may still turn out to be the same. But the only way to know for sure is to perform a second call to the DRG grouper.

In cases where the pre-HCAC DRG and the post-HCAC DRG differ, CA-MMIS will have to perform pricing logic twice, once for each DRG. The price actually used on the claim will be the price determined using the DRG code with the lower relative weight. In almost every case this will be the post-HCAC DRG. But on a very small number of claims, the DRG with the lower relative weight will be the pre-HCAC DRG. Because of these very rare cases, CA-MMIS will have to compare the relative weights of the two DRGs and when the pre-HCAC DRG has the lower relative weight, CA-MMIS will have to flip the two DRGs. Flipping the two DRGs will ensure the DRG with the lower relative weight is the one actually used to price the claim and the DRG with the higher relative weight is the one stored in the fields in the new DRG pricing side file starting with "Pre\_HCAC".

If the DRG grouping software sends back a non-zero return code, an MMIS edit should post to the claim. The APR-DRG grouping software has about a dozen return codes, and those codes need to be mapped to specific MMIS edits. (Table 7.6.5)

## BR-Pricing-7: Add logic to perform DRG pricing

New DRG pricing logic will need to be added to CA-MMIS. This logic is described in detail in a flow chart included in section 7.13 of this document. The logic is also available in detail in a DRG calculator spreadsheet.

## BR-Pricing-8: Store DRG pricing values

At the completion of DRG pricing, the values calculated will need to be stored in the CA-MMIS database. All of these values will be stored in the new claim DRG pricing file. Those values are shown in Table 7.7.4.

DRG Pricing Fields	Notes
The first set of fields contains the values used in pricing the claim. These are generally referred to as the "post-HCAC" values although in practice they are the values determined using the DRG code with the lower relative weight between the "pre-HCAC" and "post-HCAC" DRGs.	
DRG_Code	Determined by DRG grouper
DRG_MDC_Code	Determined by DRG grouper
Prov_DRG_Base_Price	Copied from the provider master file
DRG_Casemix_Rel_Wt	Copied from DRG pricing file
DRG_Pymt_Rel_Wt	If the beneficiary age is greater than or equal to the value in the age cutoff parameter, then this field equals (DRG_Casemix_Rel_Wt) * (the DRG service adjustor, either the NICU or "all other" service adjustor).  If the beneficiary age is less than the value in the age cutoff parameter, then this field equals (DRG_Casemix_Rel_Wt) * (the DRG service adjustor, either the NICU or "all other" service adjustor) * (DRG age adjustor).
Casemix_Adjstmnt_Factor	Found in a system parameter
DRG_Base_Pymt	Equals $Prov\_DRG\_Base\_Price * DRG\_Pymt\_Rel\_Wt * Casemix\_Adjstmnt\_Factor$
DRG_ALOS	Copied from DRG pricing record
Transfer_Pymt_Amt	Calculated value – in the flowchart this is referred to as "transfer payment"
Prov_CCR	Copied from the provider master file
Estimate_Gain_Loss	Calculated value
Est_Gain_Loss_Ind	"G" or "L"
DRG_Outlier_Amt	Calculated value
DRG_Outlier_Ind	Calculated value
Add_On_Pymt_Amt	Copied from the provider master file
DRG_Price_Full_Stay	Calculated value
DRG_Partial_Elig_Ind	Values are: "N" – If neither occurrence code "A2" nor "A3" were billed on the claim "D" – If occurrence code "A2" or "A3" was billed on the claim and the DRG price was used "P" – If occurrence code "A2" or "A3" was billed on the claim and the partial eligibility price was used
DRG_Partial_Elig_Price_Amt	Calculated value - in the flowchart this is referred to as "Elig-prorated-price"

Table 7.7.4 DRG Pricing Fields Stored with Each Claim	
DRG Pricing Fields	Notes
The second set of fields contains the values generally referred to as the "pre-HCAC" values although in practice they are the values determined using the DRG code with the higher relative weight between the "pre-HCAC" and "post-HCAC" DRGs. Also, extremely few claims will have any HCAC conditions. So the "pre-HCAC" values will equal the "post-HCAC" values on over 99% of the inpatient claims.	
Pre_HCAC_DRG_Cd	Determined by DRG grouper
Pre_HCAC_DRG_Casemix_Rel_Wt	Copied from DRG pricing file
Pre_HCAC_Pymt_Rel_Wt	If the beneficiary age is greater than or equal to the value in the age cutoff parameter, then this field equals (Pre_HCAC_DRG_Casemix_Rel_Wt) * (the DRG service adjustor, either the NICU or "all other" service adjustor).  If the beneficiary age is less than the value in the age cutoff parameter, then this field equals (Pre_HCAC_DRG_Casemix_Rel_Wt) * (the DRG service adjustor, either the NICU or "all other" service adjustor) * (DRG age adjustor).
Pre_HCAC_Final_Price	Calculated value
HCAC_Category	Returned by the HCAC utility. There can be multiple categories identified on a single claim, although this will be very rare. Recording the first category identified will be sufficient.

In addition, the final claim price and the DRG pricing indicator will need to be stored in the activity record, which presumably gets stored in the database at the end of the adjudication cycle. The DRG pricing indicator will probably fit well into one of the following existing fields:

- CF1-CLM-PROCESS-CD-887
- CF1-CLM-PYMNT-CALC-CD
- CF1-CLM-PAYMT-EXPLANATION-904
- CF1-CLM-PAYMT-EXPLAN-2-904
- CF1-CLM-PAYMT-EXPLAN-3-904

The new pricing method indicator values for DRG pricing should be:

- Standard DRG pricing
- Transfer claim; DRG price reduced
- Transfer claim; DRG price not reduced
- Partial eligibility; DRG price reduced
- Partial eligibility; DRG price not reduced
- DRG interim claim
- Rehabilitation claim

**Notes:**

- Only the descriptions are shown here, not the actual codes because the current values already used are not known by the authors of this SDN.
- The presence of outlier payments will be identified with a separate DRG outlier indicator stored on the new claim DRG pricing file.

## BR-Pricing-9: Allow users to view claim DRG pricing fields

Online claim header screens will need to be added or changed to display the new DRG pricing fields. These fields will NOT be updateable by a user. They will only be viewable. The fields are listed in Table 7.7.5.

Table 7.7.5 Claim Level DRG Pricing Fields Viewable Online in CA-MMIS		
Column	Format	Anticipated Location of Field
CCN	PIC X(13)	Claim DRG pricing side file
DRG_Code	PIC X(05)	Reference DRG pricing file
Final claim price	PIC S9(7).99	Existing claim file → claim activity record
DRG pricing method indicator	PIC X(01) or PIC X(03)	Existing claim file → claim activity record
DRG Description	PIC X(50)	Claim DRG pricing side file
DRG_MDC_Code	PIC X(02)	Claim DRG pricing side file
Prov_DRG_Base_Price	PIC 9(09).9(02)	Claim DRG pricing side file
DRG_Casemix_Rel_Wt	PIC 9(03).9(04)	Claim DRG pricing side file
DRG_Pymt_Rel_Wt	PIC 9(03).9(04)	Claim DRG pricing side file
Casemix_Adjstmnt_Factor	PIC 9(01).9(03)	Claim DRG pricing side file
DRG_Base_Pymt	PIC 9(09).9(02)	Claim DRG pricing side file
DRG_ALOS	PIC 9(03).9(02)	Claim DRG pricing side file
Transfer_Pymt_Amt	PIC 9(09).9(02)	Claim DRG pricing side file
Prov_CCR	PIC 9(03).9(03)	Claim DRG pricing side file
Estimated_Gain_Loss	PIC 9(09).9(02)	Claim DRG pricing side file
Est_Gain_Loss_Ind	PIC X(01)	Claim DRG pricing side file
DRG_Outlier_Amt	PIC 9(09).9(02)	Claim DRG pricing side file
DRG_Outlier_Ind	PIC X(01)	Claim DRG pricing side file
Add_On_Pymt_Amt	PIC 9(09).9(02)	Claim DRG pricing side file
DRG_Price_Full_Stay	PIC 9(09).9(02)	Claim DRG pricing side file
DRG_Partial_Elig_Price_Amt	PIC 9(09).9(02)	Claim DRG pricing side file
Pre_HCAC_DRG_Cd	PIC X(05)	Claim DRG pricing side file
Pre_HCAC_DRG_Casemix_Rel_Wt	PIC 9(03).9(04)	Claim DRG pricing side file
Pre_HCAC_Pymt_Rel_Wt	PIC 9(03).9(04)	Claim DRG pricing side file
Pre_HCAC_Final_Price	PIC 9(09).9(02)	Claim DRG pricing side file
HCAC_Category	PIC X(03)	Claim DRG pricing side file

The current expectation is that final claim header price will be stored in the same place as it is stored for all other claims, which appears to be in the field called CF1-ALLOWABLE-PROC-PAYMT. Also the DRG pricing indicator will likely be stored in one of the following fields already in existence on the claim activity record:

- CF1-CLM-PROCESS-CD-887
- CF1-CLM-PYMNT-CALC-CD
- CF1-CLM-PAYMT-EXPLANATION-904
- CF1-CLM-PAYMT-EXPLAN-2-904
- CF1-CLM-PAYMT-EXPLAN-3-904

## BR-Pricing-10: Price admin level 2 claims like admin level 1

Level 2 administrative day claims should flow through the same pricing logic as used for administrative day level 1 claims. This is existing logic within CA-MMIS that pays a per diem amount for specific revenue codes and pays additionally for specific ancillary services. Level 2 administrative day claims will be identified by the presence of one or more lines with revenue code 199. And the per diem rate will be paid to the lines with revenue code 199. The same per diem amount will be used for all providers. It has yet to be determined if this per diem amount will be stored in a system parameter or in the provider revenue code rate file. The logic used to pay certain ancillary services will be the same logic currently used for administrative day level 1 claims (claims with revenue code 169).

Administrative day level 2 care is care that is less intensive than acute care, and more intensive than the existing administrative day care, which is referred to in this document as administrative day level 1.

**Note:** A new edit will be added to deny any claim that falls into more than one pricing category, where the pricing categories are: DRG, administrative day level 1, administrative day level 2, and rehabilitation (Table 7.6.2).

## BR-Pricing-11: Add new rehabilitation service pricing logic

A new per diem payment method will be implemented for payment of rehabilitation claims. Rehabilitation claims will be identified by the presence of revenue codes 118, 128, 138, 148, and/or 158 on one or more service lines on the claim. Rehabilitation claims will be paid a per diem and one per diem is planned for all hospitals in the state. So the per diem can be stored in a system parameter or, if preferred, can be stored on the existing provider / revenue rate file. The per diem will be multiplied by the number of units for each of these five revenue codes on the claim to get the total claim price. All other lines on the claim should price at zero.

**Note:** A new edit will be added to deny any claim that falls into more than one pricing category, where the pricing categories are: DRG, administrative day level 1, administrative day level 2, and rehabilitation (Table 7.6.2).

## 7.8 Processing Final Claim after Interim Claims

### BR-Final-CIm-1: Voiding interim claims

A particularly complicated piece of the DRG pricing process is handling long hospital stays in which interim claims are billed followed by a final claim. For these types of stays the interim claims will be paid a per diem rate, which is intended to help the providers with their cash flow. Then when the beneficiary is finally discharged, a final claim will be submitted that will be priced under the normal DRG method. To perform DRG pricing on the final claim, providers will be expected to bill all the information for the full stay on the final claim. The final claim will contain the full length of stay, all diagnosis and surgical procedure codes, and all the charges for the stay.

The basic business requirement in this scenario is to ensure that the overall payment for this stay is the full DRG payment. This can be accomplished in a variety of ways. Those ways are:

- Void all the interim claims - Most states use this option. The voids take back all the money paid on the interim claims and then full payment is given to the provider through the final claim. The voids can be accomplished in the following ways
  - Manually by fiscal agent staff
  - Systematically by the MMIS
  - “Externally” by requiring the providers to submit adjustment claims

With any of these options, the final claim has to be suspended until all the voids have been entered.

- Calculate final DRG payment then reduce that payment by the total amount of money paid out on the interim claims. This option has a complication because there is a chance that the final DRG payment is less than the total payment made on the interim claims. The complication is probably enough to rule out this option as viable.

# 7.9 Reporting DRG Pricing Information

## BR-Rptng-1: Remittance advice

The DRG code assigned to each inpatient claim priced via DRGs will need to be output on the electronic (835) and paper remittance advices.

Price reductions caused by HCACs need to be communicated to providers. These claims will be identified either through a new indicator or through an exception posted to the claim.

## BR-Rptng-2: Standard DRG pricing reports

Standard DRG pricing reports will need to be built to help UMD, Safety Net Financing, and other organizations monitor payments made for inpatient acute care services. Table 7.9.1 contains a suggested list of reports. The decision as to whether these reports will be generated from the MMIS or a data warehouse can be made during system design.

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
1	Monthly	Summary of payments by Medicaid Care Category	Review trends in spending, utilization and casemix by Medicaid Care Category (MCC). See Section 6.6, #1.	All claims paid by DRG	Medicaid Care Category	Medicaid Care Category, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
2	Monthly	Summary of payments by APR-DRG	Review most common DRGs, analyze average charges and payments, analyze outlier payments as percentage of all payments, compare average length of stay against benchmark	All claims paid by DRG	APR-DRG (four-digit)	APR-DRG code, APR-DRG description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay. Also national average length of stay (from DRG file) Sort: Total stays, descending
3	Monthly	Summary of payments by hospital	Review list of top hospitals by total payments, analyze average charges and payments, analyze outlier payments as percentage of all payments	All claims paid by DRG	Hospital NPI	Hospital NPI, hospital name, in/out of state indicator, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending

Table 7.9.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
4	Monthly	Highest-paying claims	Check appropriateness of billed information and payment calculations on the most expensive claims. See Section 6.6, #3.	All claims paid by DRG (top 100 by total price)	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status Sort: Price, descending
5	Monthly	Summary of payments by DRG pricing method	Analyze how claims are being paid, prevalence of straight DRG claims vs. outlier claims etc. See Section 6.6 #5.	All claims paid by DRG	Unique combination of DRG pricing method and DRG outlier indicator	DRG pricing method indicator, DRG pricing method description, DRG outlier indicator, DRG outlier indicator description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
6	Monthly	DRG cost outlier payments.	Review outlier claims by hospital to trend hospital utilization requiring outlier payments. These claims may require more oversight from DHCS UMD.	All claims paid by DRG with DRG cost - and - outlier payment not equal to \$0	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status. Also national average length of stay (from DRG file). Sort: Cost outlier amount, descending
7	Monthly	Payments by patient discharge status	Analyze patterns of discharge destination. See Section 6.6 #5.	All claims paid by DRG	Discharge status	Discharge status, discharge status description, total stays, days, charges, estimated hospital cost, DRG casemix relative weight, DRG base payments, DRG outlier payments, price, and corresponding averages per stay Sort: Total stays, descending
8	Monthly	Interim claims	Review claims that will likely be high-paid (either outlier or high DRG base payment). These claims could be monitored by DHCS UMD after the initial 30 days.	All claims paid by DRG with discharge status = 30 - or - bill type = 112, 113	CCN	CCN, hospital NPI, hospital name, first date of service, last date of service, days, charges, estimated hospital cost, price, discharge status, all diagnosis and ICD-9-CM procedure code values and descriptions. (Interim claims do not have DRG assigned.) Sort: Hospital NPI, then beneficiary ID, then FDOS

Table 7.9.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
9	Monthly	Interim claims with no final claim	Identify situations where interim claims were submitted but no final claim was submitted. DHCS can remind hospitals to submit the final claim and or decide upon a policy, if required, to ensure that final claims are submitted. See Section 6.6, #9	Interim claims paid two months prior for which no final claim has been received. For example, a report generated at the end of April should list all interim claims paid in February for which no final claim was paid in March or April.	CCN	CCN, hospital NPI, hospital name, beneficiary ID, first date of service, last date of service, type of bill, patient discharge status charges, estimated hospital cost, price.  Interim claims are identified by patient discharge status = 30. Final claims are identified by patient discharge status equal to anything other than 30.  The report should include all interim claims for a hospital stay. Using the example of a report run in April, if an interim claim was found paid in February and did not have a final claim, then the report should also include any other interim claims for the same hospital stay. Other interim claims for the same hospital stay will be identified as having the same beneficiary ID, provider number, and admit date.  Sort: Hospital NPI, then beneficiary ID, then FDOS
10	Monthly	Short stays	Monitor possible patterns of premature discharge. See Section 6.6, # 2 & 7.	All claims paid by DRG where the LOS < 0.25 x national ALOS, subject to the restriction that ALOS > 10 days	CCN	CCN, APR-DRG, hospital NPI, hospital name, first date of service, last date of service, length of stay, national ALOS, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status  Sort: Hospital NPI, then APR-DRG, then beneficiary ID
11	Monthly	Long stays	Analyze prevalence and payment for long stays, which tend to be expensive, medically complex and/or difficult to discharge.	All claims paid by DRG with length of stay > threshold (e.g., 30 days)	CCN	CCN, APR-DRG, hospital NPI, hospital name, days, charges, estimated hospital cost, LOS, DRG LOS , DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status.  Sort: Hospital NPI, then APR-DRG, then beneficiary ID

Table 7.9.1

## Examples of Routine Reports

No.	Frequency	Report	Purpose	Universe	Key Field(s)	Information Fields
12	Daily	Suspect duplicate or unbundling situation	Identify situations where there is more than one paid claim a single inpatient stay. See Section 6.6, #6, #8	Paid claims for the same patient with overlapping FDOS→LDOS date spans, hospital inpatient or hospital outpatient bill type	CCN	CCN, APR-DRG, hospital NPI, hospital name, charges, estimated hospital cost, DRG casemix relative weight, DRG base payment, DRG outlier payment, price, discharge status, admin date, discharge date, LOS, bill type Sort: Beneficiary ID, then FDOS, then hospital NPI
13	Monthly, quarterly	Health care-acquired conditions (HCAC) - Systematic Payment Adjustment	To support HCAC reporting to CMS. See Section 4.10.1.	All claims paid by DRG where the HCAC field indicates the presence of HCAC	CCN	CCN, hospital NPI, hospital name, pre-HCAC DRG code, pre-HCAC DRG casemix relative weight, post-HCAC DRG, post HCAC DRG casemix relative weight, days, charges, estimated hospital cost, HCAC category, HCAC payment reduction indicator, post-HCAC price, pre-HCAC price Sort: Hospital NPI, then HCAC category
14	Monthly, quarterly	Health care-acquired conditions (HCAC) – Manual Payment Adjustment	These indicate claims that require manual review of the HCAC in order to price the claim because to reflect Medi-Cal HCAC policy.	All claims NOT paid by DRG where the HCAC field indicates the presence of HCAC	CCN	CCN, hospital NPI, hospital name, pre-HCAC DRG code, pre-HCAC DRG casemix relative weight, post-HCAC DRG, post HCAC DRG casemix relative weight, days, charges, estimated hospital cost, HCAC category, HCAC payment reduction indicator, price Sort: Hospital NPI, then HCAC category
15	Quarterly	POA Indicators	Evaluate the appropriate use of POA indicators by trending the frequency of all values. See Section 6.6, # 10.	All claims	POA	Hospital NPI, hospital name, total # of claims, POA field (e.g., values Y, N, W etc.). Sort: Total stays, descending

*Notes:*

- 1 Sample reports are listed for consideration by DHCS, and would have to be configured to reflect specific data fields in CA-MMIS or the paid claims warehouse.
- 2 CCN=claim control number, LOS=length of stay for the specific claim; ALOS=national average length of stay for the specific APR-DRG.
- 3 Casemix equals average DRG relative weight. For purposes of reporting, casemix should be measured without reference to any policy adjusters. The reason is that the casemix weights serve as national benchmarks and should change only when national data change.
- 4 Estimated hospital cost is calculated as submitted-charges times hospital cost-to-charge ratio.
- 5 All reports should include a total line.

## BR-Rptng-3: Data warehouse extracts

Some of the new claim DRG pricing fields, new reference DRG pricing fields, and new provider pricing fields will need to be extracted and made available for data warehouses. The claim fields that should be made available to data warehouses are:

# 7.10 Database Changes

## BR-DB-1: Add a reference DRG pricing file

A new Reference DRG pricing file needs to be created. This file will be updated once a year and about 1,300 rows will be added each year. The file needs to be accessible to the inpatient pricing logic within the adjudication process. The file should also be viewable and updateable online in CA-MMIS. Fields in this file are:

Table 7.10.1 New Reference DRG pricing file		
Column	Format	Description
DRG_Code	PIC X(05)	Unique key is DRG_Code and Begin_Dt
Eff_Begin_Dt	Standard CA-MMIS date format	Unique key is DRG_Code and Begin_Dt
Eff_End_Dt	Standard CA-MMIS date format	
DRG_Description	PIC X(100)	
DRG_ALOS	PIC 9(03)V9(02)	Average length of stay
DRG_Casemix_Rel_Wt	PIC 9(03)V9(04)	Relative weight
DRG_Svc_Adjstr_All_Others	PIC 9(03)V9(02)	Relative weight adjustor based on the type of service. Also known as the "policy adjustor". Applicable to all providers except those operating a designated NICU.
DRG_Svc_Adjstr_Desig_NICU	PIC 9(03)V9(02)	Relative weight adjustor based on the type of service. Also known as the "policy adjustor". Applicable to providers operating a designated NICU.
DRG_Age_Adjstr	PIC 9(03)V9(02)	Relative weight adjustor based on the beneficiary age. Only beneficiaries younger than the age threshold get the age adjustor applied.
Mcaid_Care_Categ_Adult	PIC X(50)	A categorization of DRGs applicable for claims where the beneficiary is an adult
Mcaid_Care_Categ_Child	PIC X(50)	A categorization of DRGs applicable for claims where the beneficiary is a child
DRG_On_Review_Ind	PIC X(01)	Used to suspend claims
Last_Updt_User_ID	Standard CA-MMIS format	
Last_Updt_Date_Time	Standard CA-MMIS format	

## BR-DB-2: Provider master file

The following provider-specific fields need to exist in CA-MMIS to support APR-DRG pricing. These fields may already exist within the provider master file. If they do, no changes are needed. If they do not, then they will need to be added either to an existing file or to a new file. These fields are all date sensitive. Each needs to be “bracketed” with begin and end effective dates.

Table 7.10.2 Provider-Specific Fields Supporting DRG Pricing		
Column	Format	Description
Cost-to-charge ratio	PIC 9(1)V9(05)	This value is calculated by the Audits and Investigations unit. It is the same thing as the interim rate currently loaded for non-contract hospitals.
Inpatient payment method	PIC X(1)	Valid values will be “P” for per diem pricing and “D” for DRG pricing. Other values may also be needed to identify other pricing methods. For most providers of type 016 and 060, this value will be “D” for dates after the cut-over to DRG pricing. However, the value will be “P” for designated public hospitals because they will continue to be paid via a per diem method. Possibly the contract/non-contract indicator could be used for this field.
DRG base price	PIC 9(09)V9(02)	Provider-specific value used in DRG pricing
Per-claim add-on payment	PIC 9(09)V9(02)	Provider-specific payment amount added to the DRG payment for claims priced under the DRG method.
Designated NICU indicator	PIC X(1)	Value must be “Y” or “N”. This field is used in the DRG pricing outlier calculation.  Note: it’s possible an indicator already exists in the provider master file for this value. If not, it’s possible a system list could be used instead of adding a new value to the provider master file. However, there will be at least 12 NPIs in that system list, totaling 120 characters.

## BR-DB-3: Claim input from provider side file

A new file will be needed to capture claim data submitted by providers that is not currently captured or used in CA-MMIS. This data will likely be captured in a process very similar to the one built to capture data under the EDI 5010 project. However, for the DRG project, these additional fields will need to be captured on both electronic and paper claims. Also, the fields will only be needed on hospital inpatient and inpatient Medicare crossover claims.

Fields in this new file are shown in Table 7.10.3.

Table 7.10.3 Additional Submitted Claim Fields Needed for DRG Pricing		
Column	Format	Description / Notes
E-Diag_Cd_6	PIC X(07)	
Occurrence_Cd_1	PIC X(02)	Only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic.
Occurrence_Cd_2	PIC X(02)	Only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic.
Occurrence_Cd_3	PIC X(02)	Only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic.
Occurrence_Cd_4	PIC X(02)	Only occurrence codes A2 and A3 are needed for DRG pricing. So, not all occurrence codes actually need to be retrieved. Yes/No indicators specifying whether occurrence code A2 and A3 were billed on the claim will be sufficient to meet the needs of the DRG pricing logic.

This data must be easily accessible to the inpatient claims pricing process performed within claims adjudication using CCN as the primary key. Once a claim has been paid, the record for that claim can be moved to a historical file that is less easily accessible. However, the claim adjustment process must be able to retrieve these fields when making a new copy of a claim. In addition, the fields will need to be accessible for extracts to data warehouses and accessible for standard claim audits.

## BR-DB-4: Claim DRG pricing file

Several new fields will need to be added at the claim header level in support of DRG pricing. These fields can be added to existing claim files or to a new claim file. One record will exist in this file for each inpatient claim for which the provider type is 016 or 060. This document assumes that these fields will be added in a new claims DRG pricing “side file” as a separate side file is expected to require less development effort than adding all these fields to the existing claim activity record.

For claims not pricing via DRGs, this record will only be used to support HCAC requirements. So the DRG codes and their associated parameters will be populated, but none of the payment fields will be populated.

Fields in the new claim DRG pricing file are shown in Table 7.10.4.

Column	Format	Description
CCN	PIC X(13)	Claim control number – unique key to this file
DRG_Code	PIC X(05)	Diagnosis related grouping code
DRG_MDC_Code	PIC X(02)	Major diagnostic category
Prov_DRG_Base_Price	PIC 9(09)V9(02)	Per claim provider specific base price for DRG payments
DRG_Casemix_Rel_Wt	PIC 9(03)V9(04)	Casemix relative weight – prior to applying policy and age adjustors
DRG_Pymt_Rel_Wt	PIC 9(03)V9(04)	Relative weight actually used in pricing – equals casemix relative weight times policy adjustor and times age adjustor if beneficiary is a child
Casemix_Adjstmnt_Factor	PIC 9(01)V9(03)	A payment multiplier applied to all non-interim claims paid via DRG method.
DRG_Base_Pymt	PIC 9(09)V9(02)	Provider base price times DRG payment relative weight
DRG_ALOS	PIC 9(03)V9(02)	Average length of stay
Transfer_Pymt_Amt	PIC 9(09)V9(02)	Only populated on transfer claims
Prov_CCR	PIC 9(03)V9(03)	Provider cost to charge ratio
Estimate_Gain_Loss	PIC 9(09)V9(02)	Estimate of provider’s gain or loss
Est_Gain_Loss_Ind	PIC X(01)	“G” = gain “L” = loss
DRG_Outlier_Amt	PIC 9(09)V9(02)	Outlier payment amount
DRG_Outlier_Ind	PIC X(01)	“N” – none “G” – provider gain outlier “L” – provider loss outlier
DRG_Price_Full_Stay	PIC 9(09)V9(02)	Price before considering partial eligibility

Table 7.10.4

## Fields in New Claim DRG Pricing File

Column	Format	Description
DRG_Partial_Elig_Ind	PIC X(01)	<p>"N" – If neither occurrence code "A2" nor "A3" were billed on the claim</p> <p>"D" – If occurrence code "A2" or "A3" was billed on the claim and the DRG price was used</p> <p>"P" – If occurrence code "A2" or "A3" was billed on the claim and the partial eligibility price was used</p>
DRG_Partial_Elig_Price_Amt	PIC 9(09)V9(02)	Price calculated with a per diem method on claims with partial eligibility
Add_On_Pymt_Amt	PIC 9(09)V9(02)	Per claim provider-specific add-on payment
Pre_HCAC_DRG_Cd	PIC X(05)	DRG code with higher relative weight. In most cases the "pre-HCAC" and "post-HCAC" DRGs will be the same in which case the value in this field will equal the value in field DRG_Code
Pre_HCAC_DRG_Casemix_Rel_Wt	PIC 9(03)V9(04)	Casemix relative weight for the DRG code with higher relative weight. In most cases the "pre-HCAC" and "post-HCAC" DRGs will be the same in which case the value in this field will equal the value in field DRG_Casemix_Rel_Wt.
Pre_HCAC_Pymt_Rel_Wt	PIC 9(03)V9(04)	Payment relative weight for the DRG code with higher relative weight. This value equals the Pre_HCAC_DRG_Cd's casemix relative weight times policy adjustor and times age adjustor if beneficiary is a child. In most cases the "pre-HCAC" and "post-HCAC" DRGs will be the same in which case the value in this field will equal the value in field DRG_Pymt_Rel_Wt.
Pre_HCAC_Final_Price	PIC 9(09)V9(02)	Price determined using the pre-HCAC DRG code and all its associated parameters. In most cases the "pre-HCAC" and "post-HCAC" DRGs will be the same in which case the value in this field will equal the value in field CF1-ALLOWABLE-PROC-PAYMT.

Table 7.10.4

## Fields in New Claim DRG Pricing File

Column	Format	Description
HCAC_Category	PIC X(03)	<p>Value returned from HCAC utility. Currently the value is two characters in length, but a 3 character field is being recommended in CA-MMIS in case the width of this field changes over time. Additional categories may be added in the future by CMS.</p> <p>More than one HCAC category can be assigned to a single claim because the HCAC categories are assigned to individual diagnosis codes. But claims with more than one category will be extremely rare. It will be acceptable to store the first HCAC category found on the claim – that is the one from the diagnosis code closest to the principal diagnosis code.</p> <p>Valid values for this field are:</p> <p>00 = No HCAC assigned</p> <p>01 = Foreign Object Retained After Surgery</p> <p>02 = Air Embolism</p> <p>03 = Blood Incompatibility</p> <p>04 = Stage III &amp; IV Pressure Ulcers</p> <p>05 = Falls and Trauma</p> <p>06 = Catheter Associated Urinary Tract Infection</p> <p>07 = Vascular Catheter Associated Infection</p> <p>08 = Surgical Site Infection</p> <p>09 = Manifestations of Poor Glycemic Control</p> <p>10 = Deep Vein Thrombosis</p> <p>11 = Surgical Site Infection - Bariatric Surgery</p> <p>12 = Surgical Site Infection - Certain Orthopedic procedures</p>

Records in this file will be added during the adjudication process. Whether this is done during daily adjudication or weekly adjudication will be determined during the technical design phase of this project. In most MMISs, these records get created during pricing. However, it would be acceptable to assign DRGs to claims prior to pricing, and if that option is chosen, records in this file would get added when a DRG code is assigned to the claim.

No field exists in this new table holding the final price for the claim. This SDN was written under the assumption that a field whose purpose is to hold the final price of a claim already exists in the activity record and is called CF1-ALLOWABLE-PROC-PAYMT. In addition, there is no pricing indicator field in the new claim DRG pricing table. This SDN assumes an existing field in the claim activity record can be used to store values indicating how the claim priced (such as straight DRG, DRG with a transfer reduction, or DRG with a partial eligibility reduction). One of the following fields on the claim activity record may be useable for holding these values:

- CF1-CLM-PROCESS-CD-887
- CF1-CLM-PYMNT-CALC-CD
- CF1-CLM-PAYMT-EXPLANATION-904
- CF1-CLM-PAYMT-EXPLAN-2-904
- CF1-CLM-PAYMT-EXPLAN-3-904

This topic is also discussed in requirement BR-Pricing-8.

The new claim DRG pricing side file will not need to be accessible when building adjustment claims. This is because the final claim price and the DRG pricing method indicator will exist on the claim activity record and not on the side file. When creating a new copy of a claim during the adjustment process, none of the fields in this file will need to be copied from the original claim. All of these fields will get recalculated when the new adjustment claim goes through adjudication. Whether or not a record will need to be created in this side file for credits/voids of inpatient claims will need to be determined during the technical design phase of this implementation.

Records in this file will need to be accessible as long as the claim is processing through adjudication and payment. Once payment is complete, the data will need to be accessible for standard data warehouse extracts. The data will also need to be accessible for standard claim audits.

# 7.11 Data Configuration

## BR-Config-1: Initial implementation data configuration

The following tasks will need to be performed in each test environment and in production just prior to implementing DRG pricing.

- Enter all the system parameters and system lists
- Load initial values for all DRG codes into the DRG pricing reference file
- Identify hospitals of type 016 and 060 that are active in 2013 but are not in the DRG simulation dataset.
- Load and/or confirm cost-to-charge ratios for all providers getting paid via DRGs. In the past, cost-to-charge ratios were only updated in CA-MMIS if they changed by more than 3%. With DRG pricing, cost-to-charge ratios are more critical to the pricing calculations and will need to be updated annually, no matter how small values change year-to-year.
- Load the inpatient claim payment method on all providers that bill inpatient claims
- Load the following values on all providers that will be paid via DRGs:
  - DRG base price
  - Designated NICU indicator
  - Per-claim add-on payment (expected to be zero for all providers)
- End date the provider revenue code per diem rates for providers that will be paid via DRGs. The only revenue codes that should have spans in effect after the DRG go-live date are administrative day revenue codes (169 and 199) and the rehabilitation revenue codes (118, 128, 138, 148, and 158). And these exceptions are true only if the final technical design includes storage of these per diems on the provider / revenue code file instead of the system parameter file.
- End date the rate on some of the provider procedure code rate records. Some procedure codes will continue to be billable separately on outpatient claims for inpatient hospital stays. So some records will remain in effect. But the list of procedure codes separately payable will be smaller thus requiring many records to be end dated.
- Add new provider procedure rate records. Under the current Selective Provider Contracting Program, only contract providers are allowed to bill separately on outpatient claims for specific services provided in an inpatient setting. Also, the list of billable services can differ from one contract hospital to another. Under DRG pricing, the list of separately billable services will be smaller and will apply to all hospitals being paid via DRGs. In addition, the list of separately billable services will be the same for every provider. So the appropriate rate records will need to be added to all non-contract hospitals and an analysis will need to be performed to ensure this list of procedures exists on all contract providers.

## 7.12 Unresolved Requirements

### BR-Unreslvd-1: CCS and non-CCS payment on a single stay

DRG payment is designed to be a single payment for an entire hospital stay. This creates a challenge for stays, most commonly sick newborn stays, in which the beneficiary is categorized as CCS for part of the stay and regular Medi-Cal fee-for-service for another part of the stay. If a single hospital treats a beneficiary with both types of eligibility in a single hospital stay, a conflict exists between the need to calculate a single payment for the stay and the need to separate CCS payments from regular Medi-Cal fee-for-service payments. The most appropriate way to handle this scenario from a business point of view is to ask providers to bill the entire stay on a single claim and to handle the distribution of payment to CCS and Medi-Cal fee-for-service accounts within CA-MMIS. Unfortunately, this option goes against the fundamental design within CA-MMIS for handling separation of CCS and non-CCS payments. The fundamental design requires the CCS portion of the stay and the non-CCS portion of the stay to be on separate claims. Changing this design will likely be impractical. No resolution has currently been identified for this scenario. It is unknown whether the business requirement can be modified or if a practical technical implementation solution can be identified.

**Note:** The CCS unit within DHCS is considering a change to CCS eligibility policy that would result in beneficiaries being CCS eligible for entire hospital stays. If this policy change is implemented, it would resolve the technical issues described here.

# 7.13 Payment Policy Flowchart

The following flowchart describes the DRG pricing logic in detail.

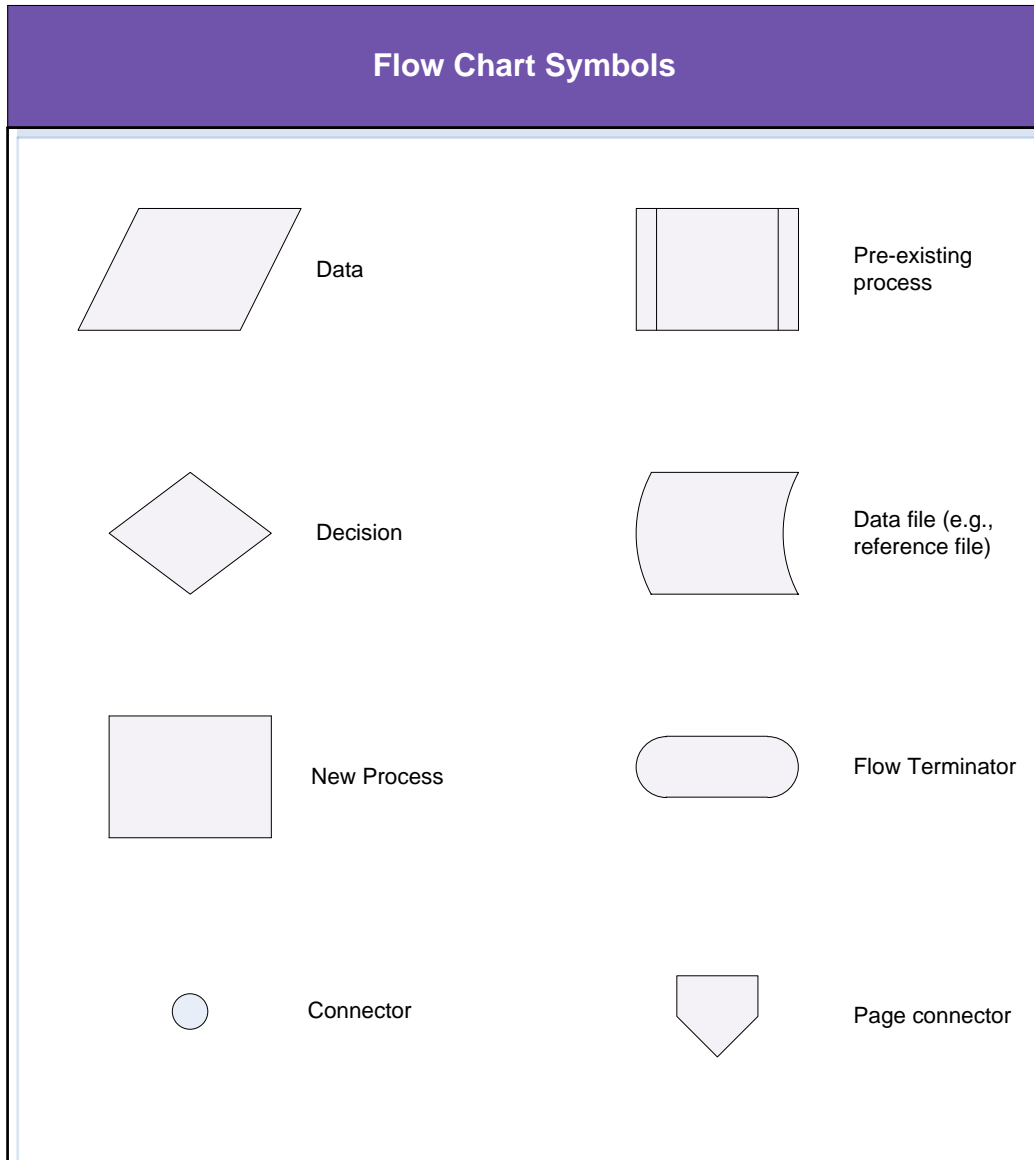

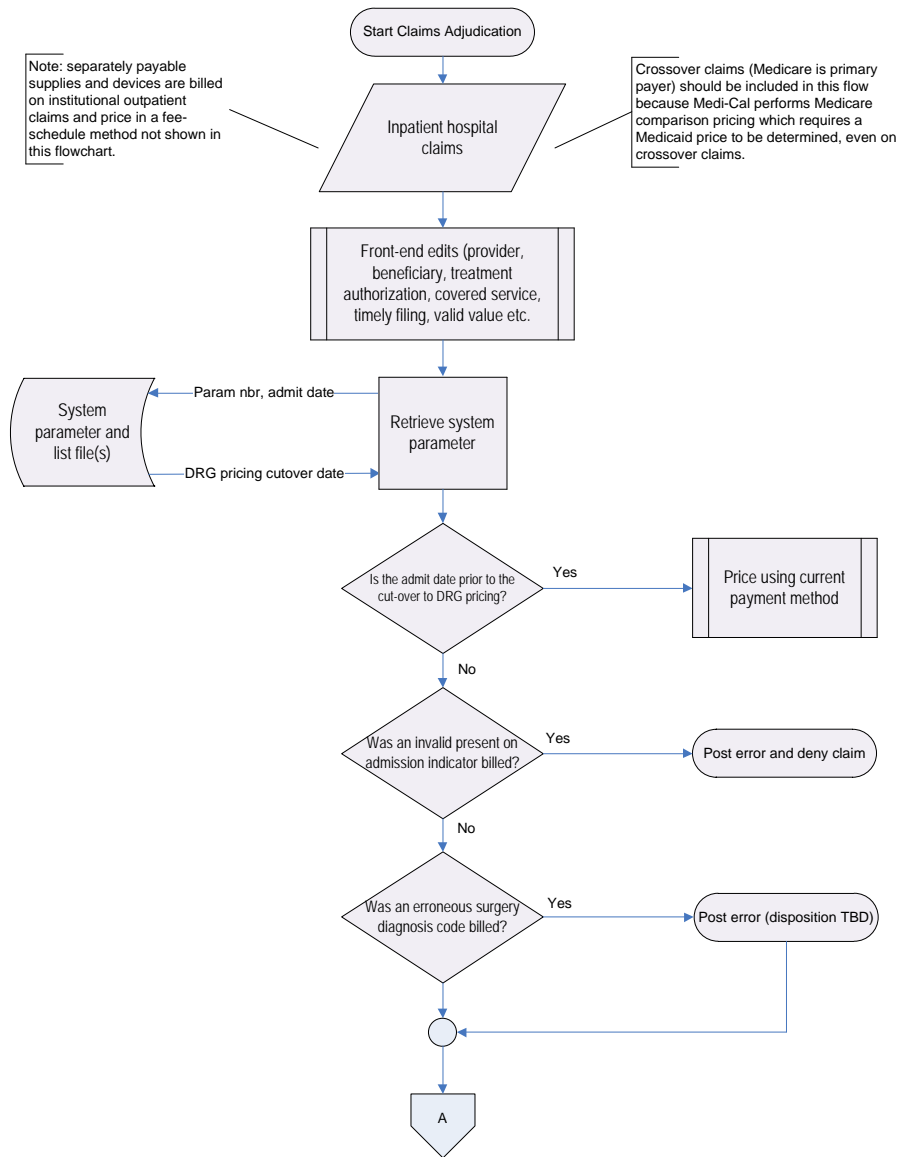

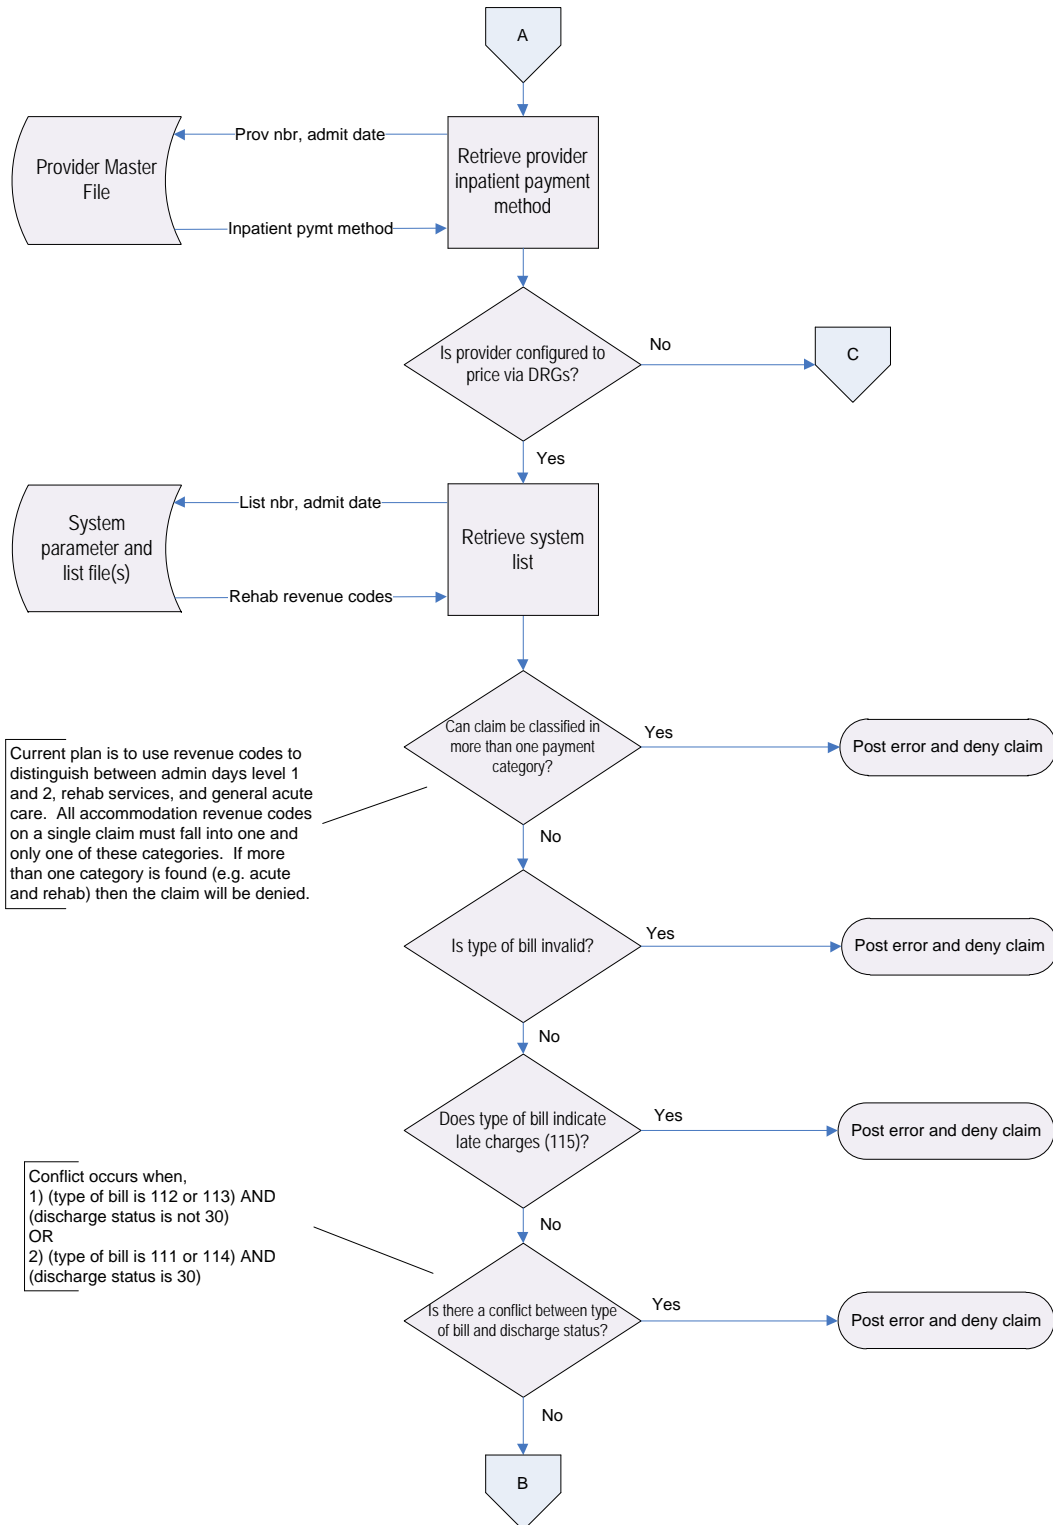

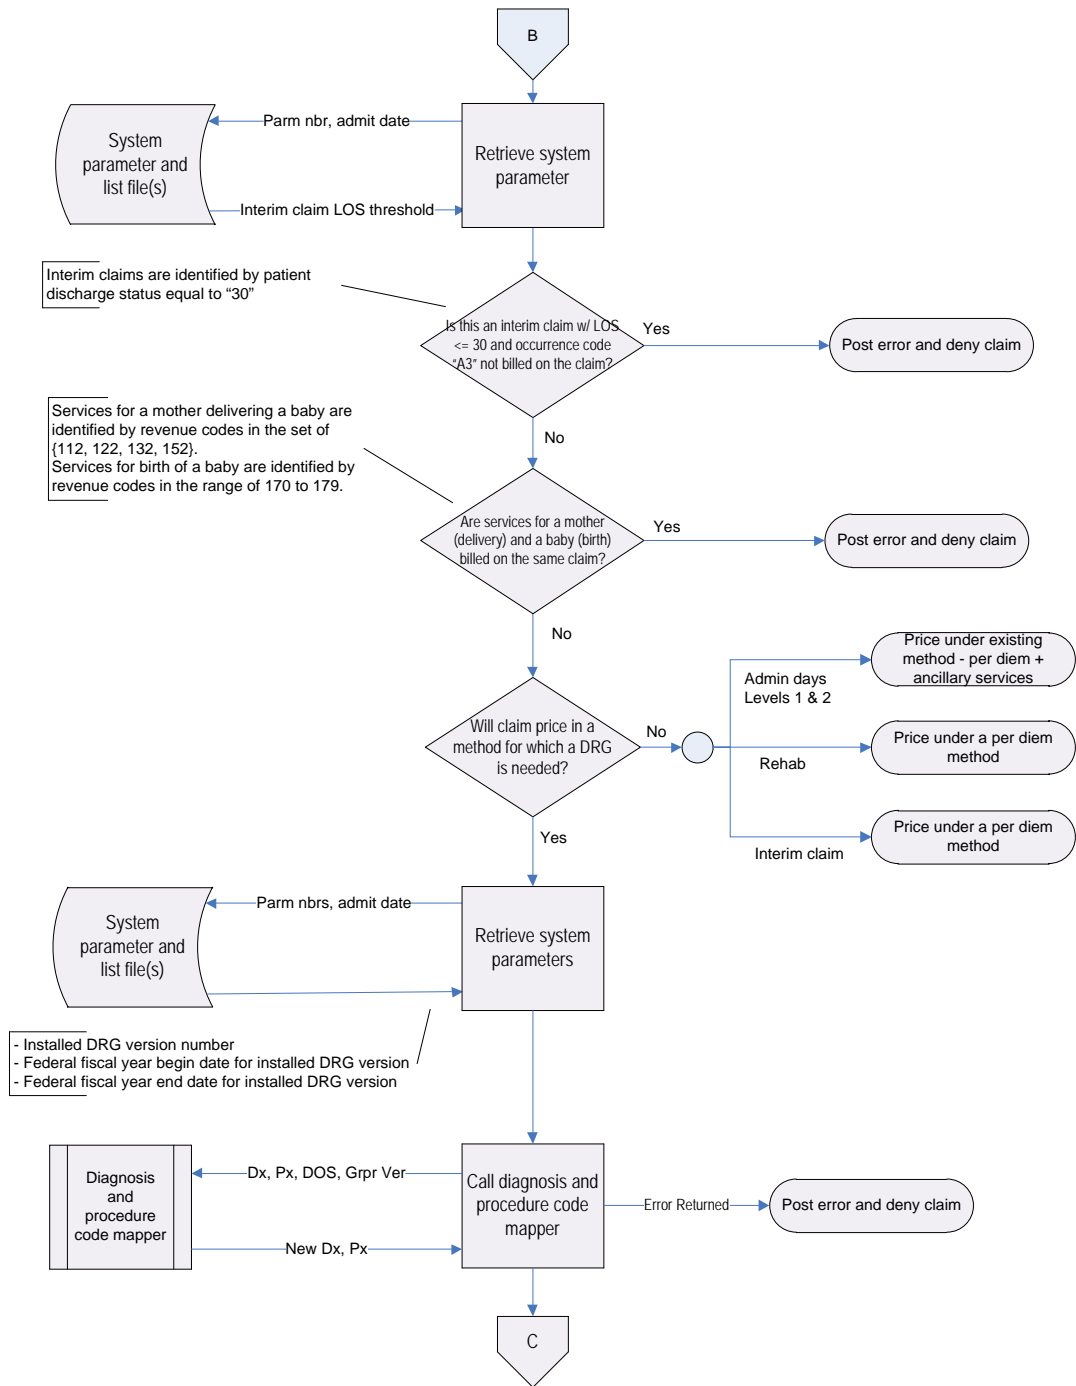

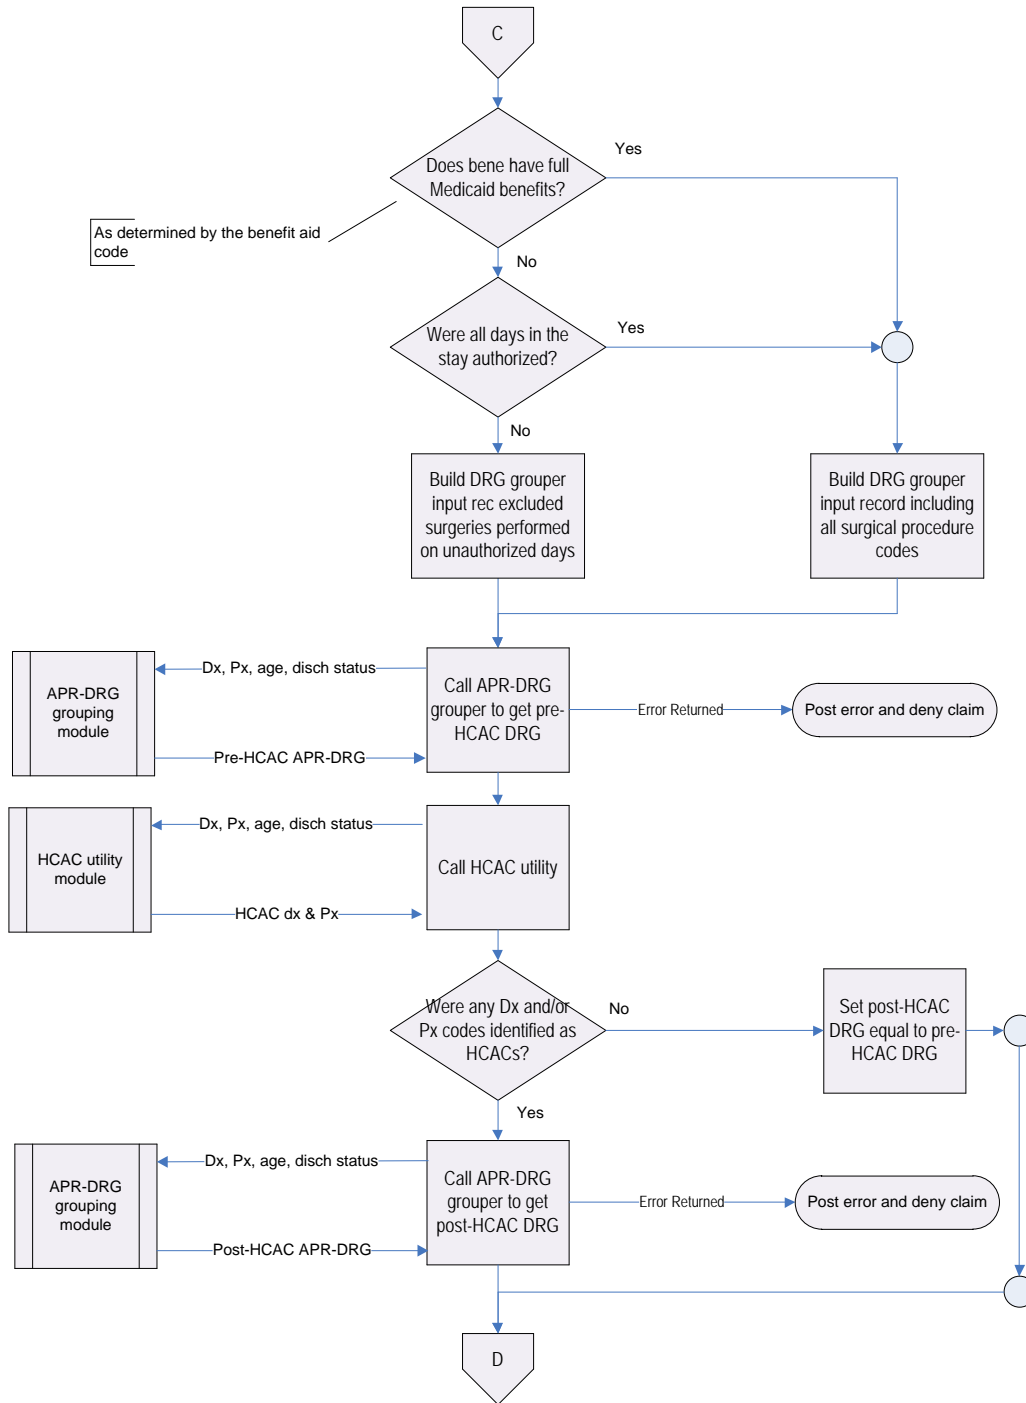

Chart 7.13.1 DRG Pricing Flowchart

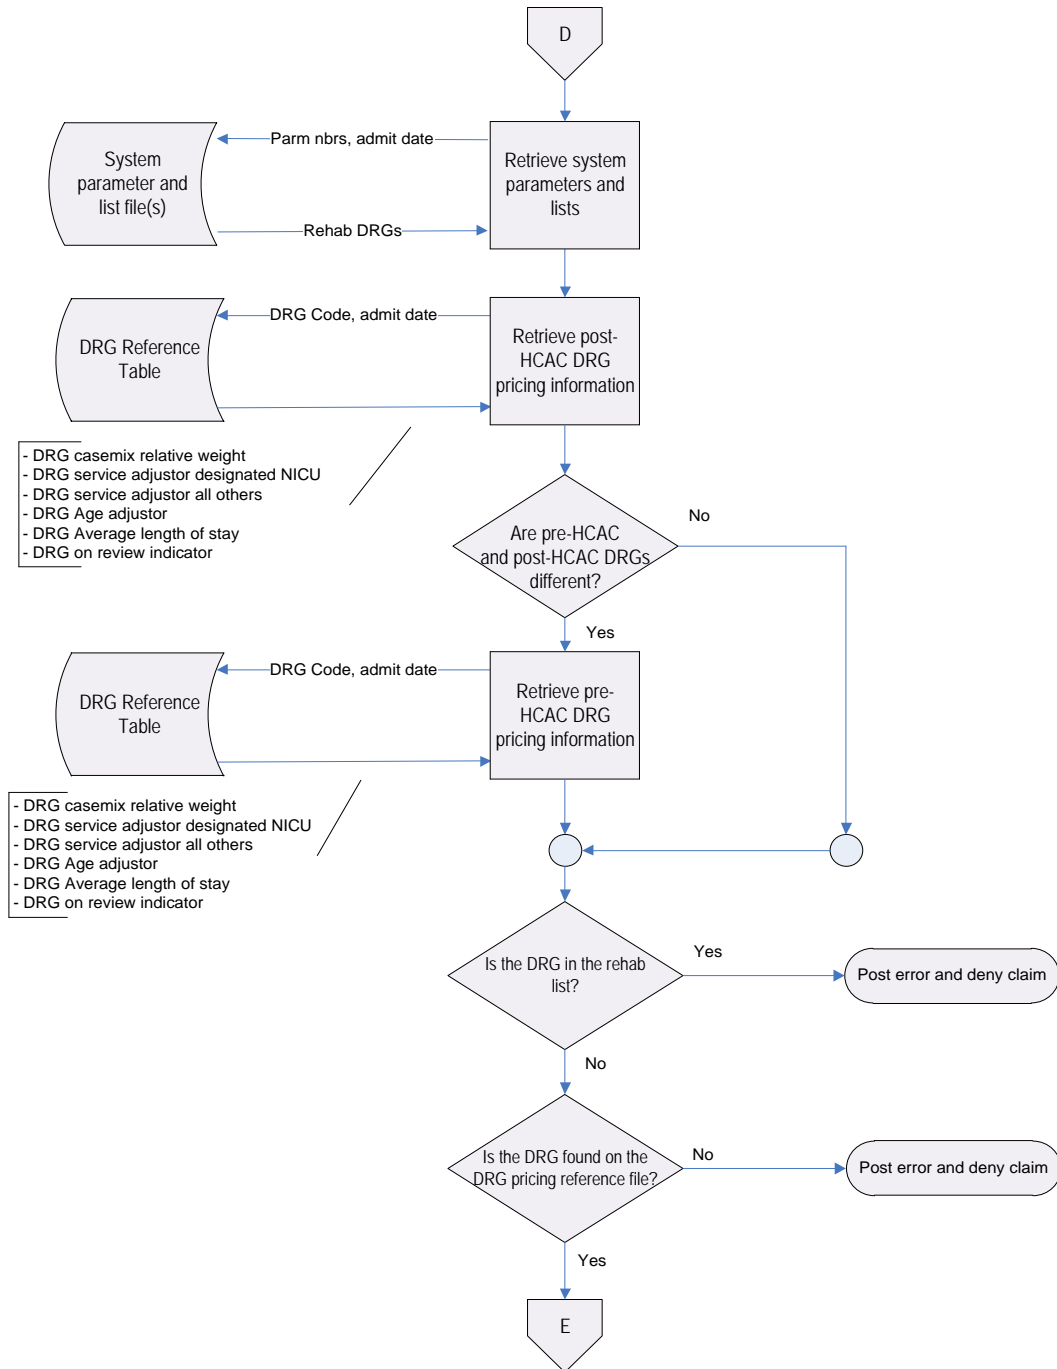

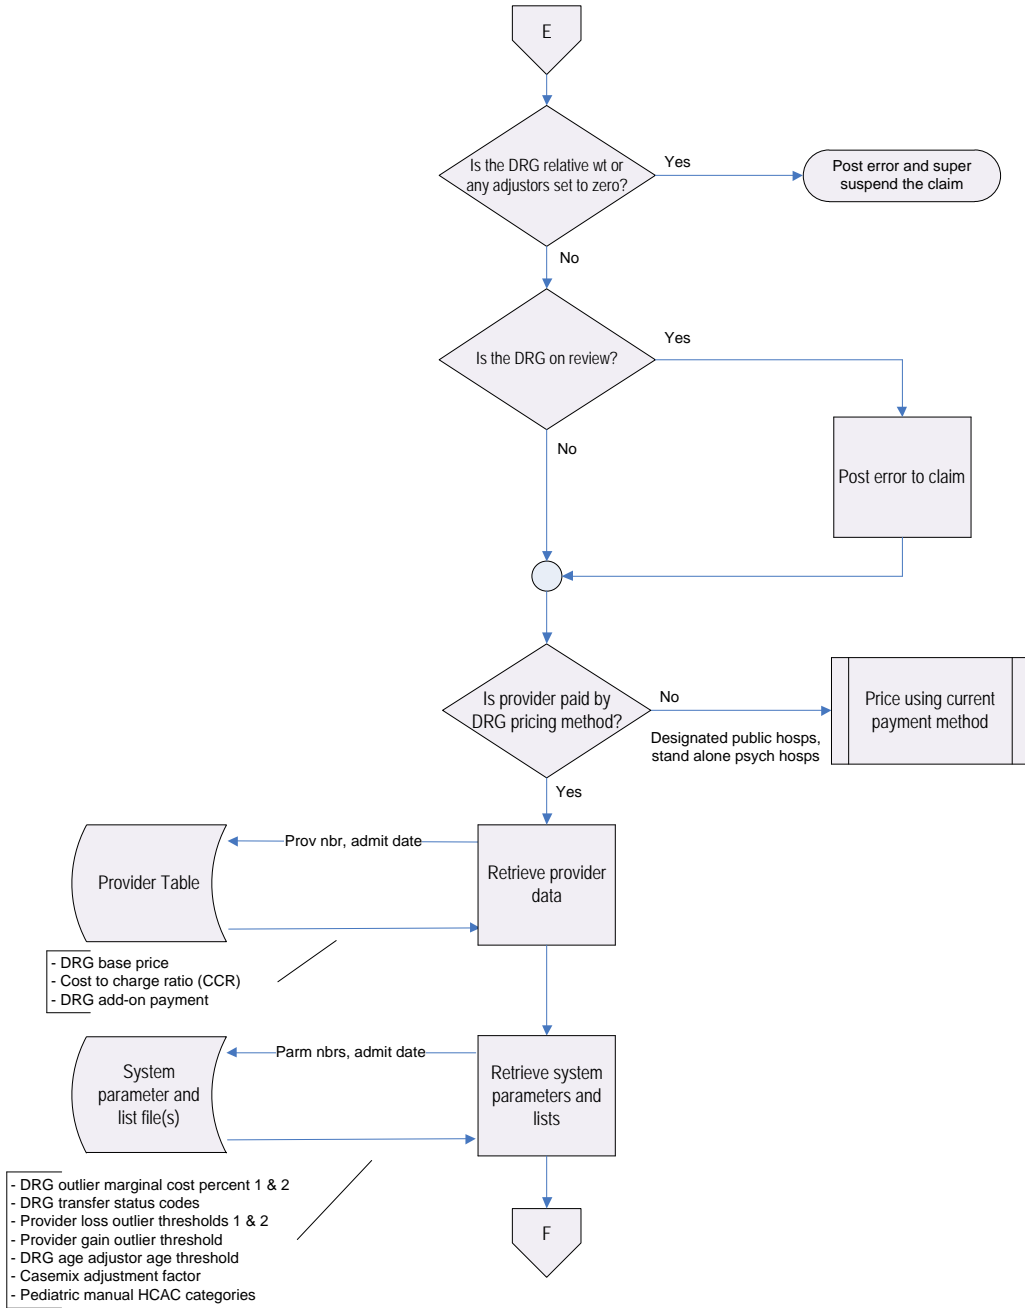

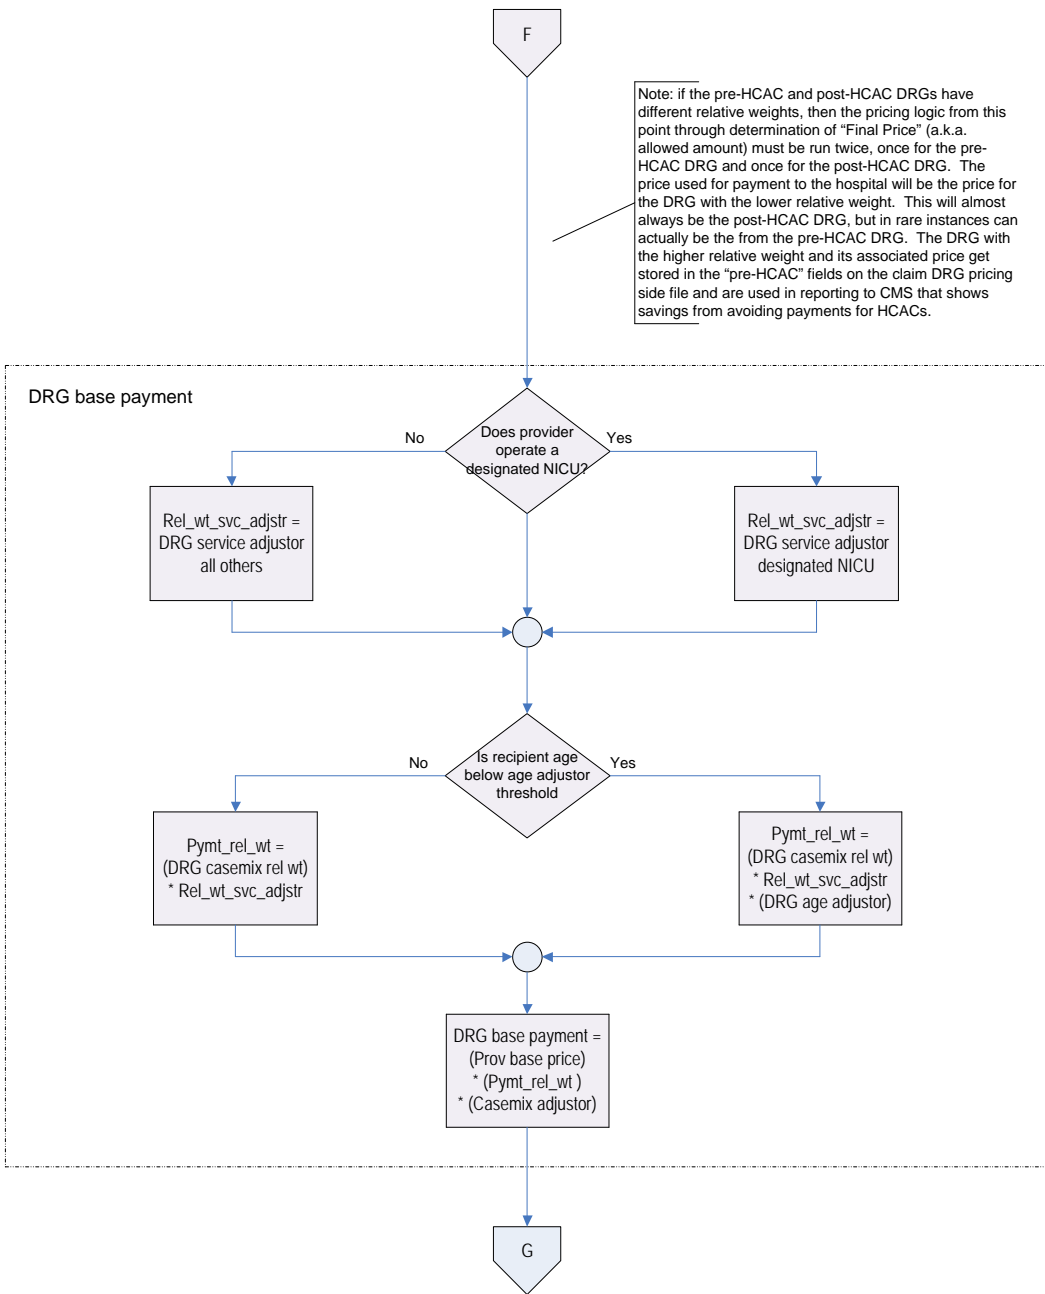

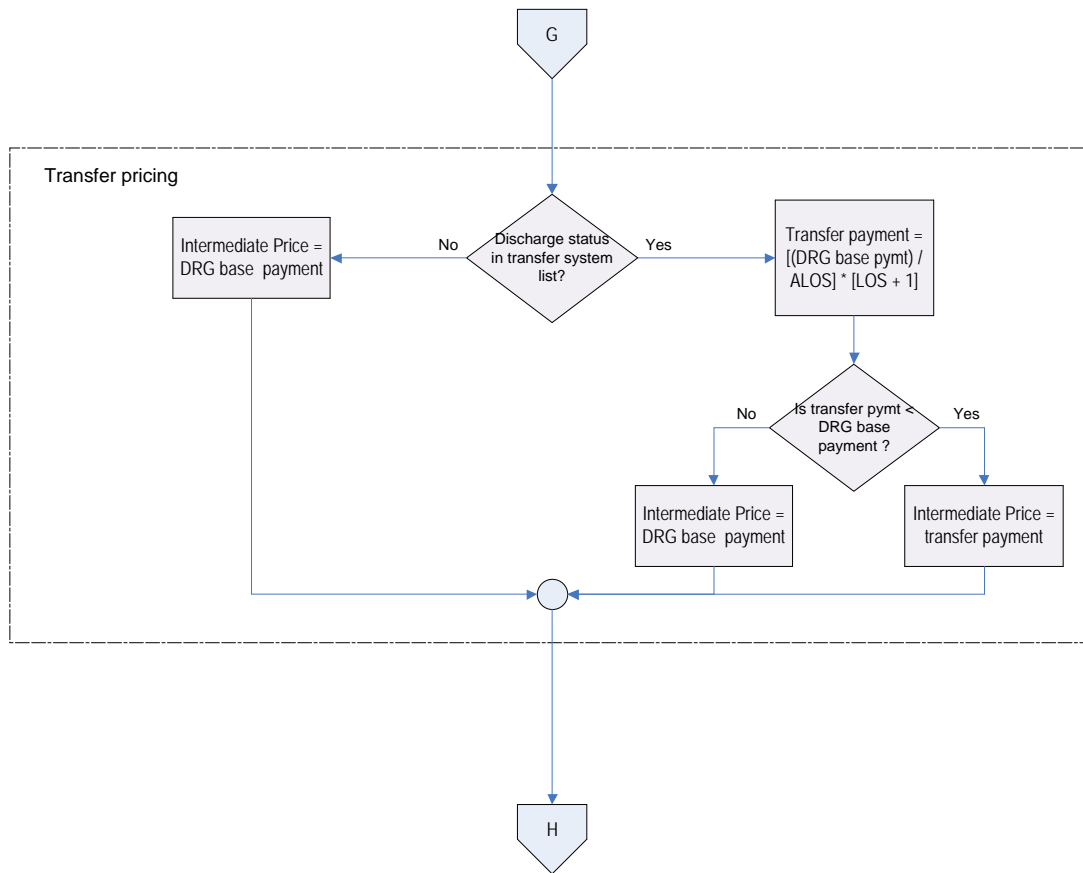

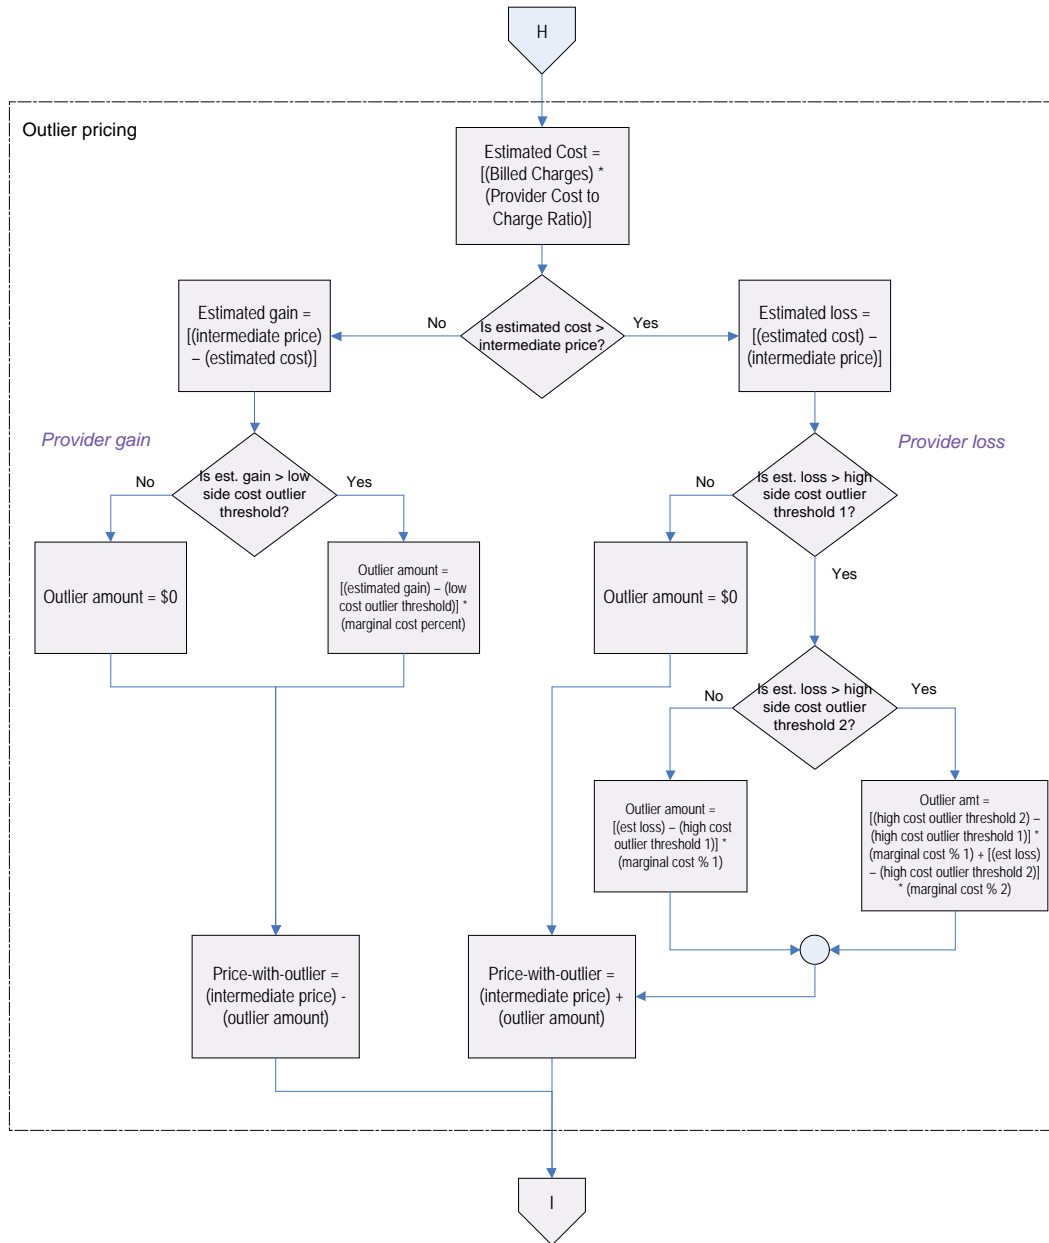

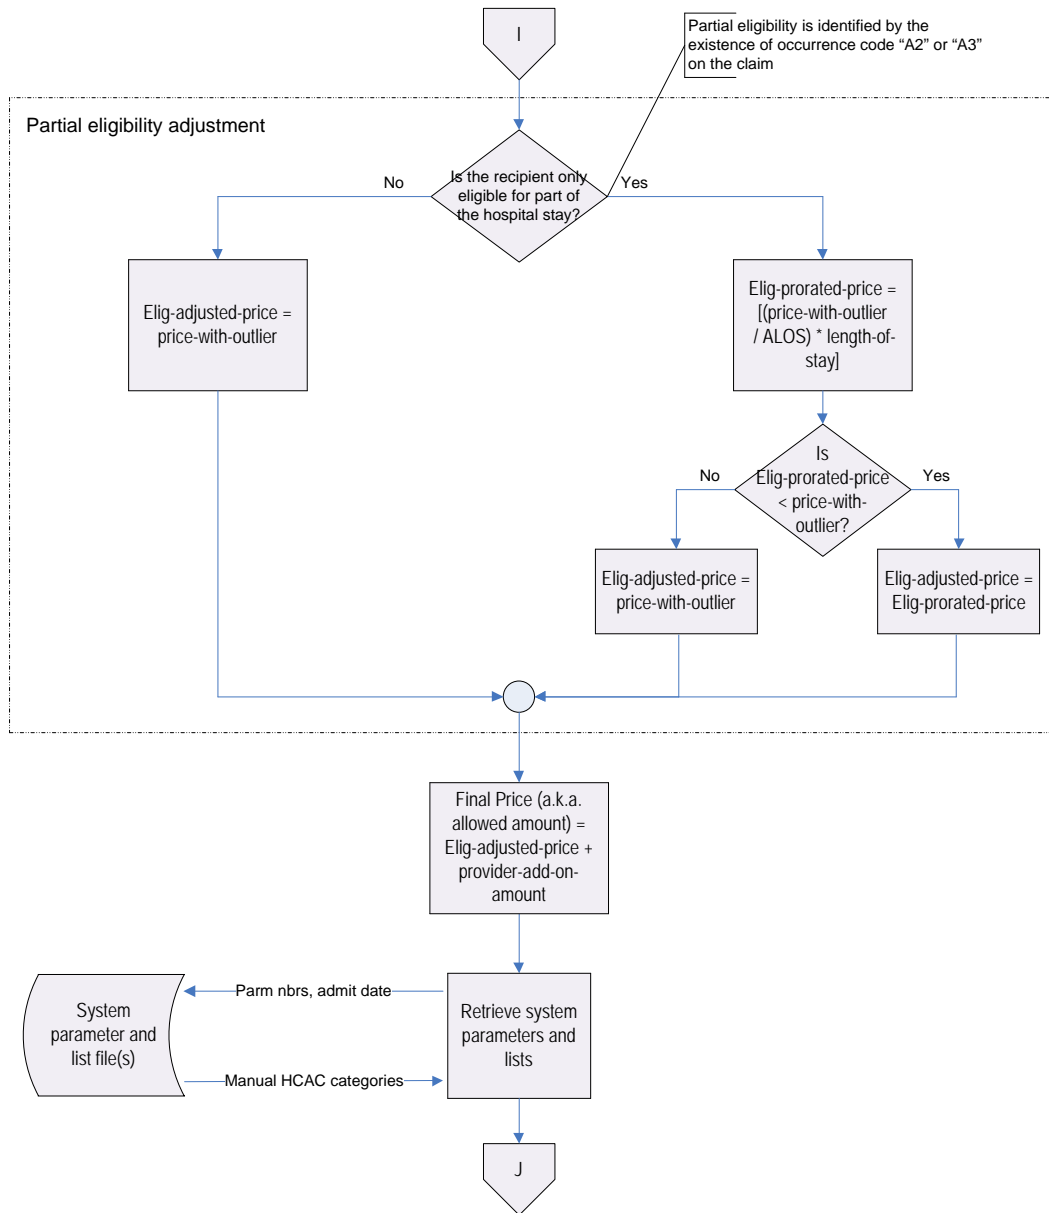

Note: if the pre-HCAC and post-HCAC DRGs have different relative weights, then the pricing logic from this point through determination of "Final Price" (a.k.a. allowed amount) must be run twice, once for the pre-HCAC DRG and once for the post-HCAC DRG. The price used for payment to the hospital will be the price for the DRG with the lower relative weight. This will almost always be the post-HCAC DRG, but in rare instances can actually be from the pre-HCAC DRG. The DRG with the higher relative weight and its associated price get stored in the "pre-HCAC" fields on the claim DRG pricing side file and are used in reporting to CMS that shows savings from avoiding payments for HCACs.

Notes:

- 1 Medicaid Care Category (MCC) is a categorization algorithm developed by Xerox for analyses such as these. They are aligned with both the policy areas of a typical Medicaid program and the internal organization of a typical hospital to allow insight into utilization and cost for services paid for Medi-Cal beneficiaries.
- 2 Average length of stay and casemix relative values were calculated from the Nationwide Inpatient Sample by 3M Health Information Systems for APR-DRG V.29.
- 3 Average length of stay is the untrimmed arithmetic value

<b>Out-of-state hospitals</b>								<b>1,520</b>
<b>All Stays</b>								<b>446,715</b>

*Notes:*

- Hospitals are not included in this table if they did not have any stays in the simulation baseline dataset.
- Stays refer to Medi-Cal fee-for-service stays in the simulation baseline dataset.
- Physical Location Wage Area based on FY 2012 Medicare geographic wage areas. Wage Area for Simulation as recognized by Medicare in FY 2012 which will be used in DRG payment method simulations
- Source for the wage area is FY 2012 IPPS Final Rule Home Page available at <https://www.cms.gov/AcuteInpatientPPS/FR2012/>, then selecting the Wage Index Final Rule and Correction Notice Tables. Source for the wage indices is the FY 2012 Final Rule- IPPS Impact File available at the same location, then selecting the Impact file.
- Assignment of hospitals to specific wage areas is subject to correction before implementation of the DRG payment method
- Corrections and updates are welcome; please contact yleana.sanchez@acs-inc.com.

# Endnotes

---

<sup>1</sup> The bill also made changes to §14105.281, but these were effectively repealed by Senate Bill 90 in the 2011-2012 legislature.

<sup>2</sup> See, for example, Robert F. Coulam and Gary L. Gaumer, “Medicare’s Prospective Payment System: A Critical Appraisal,” *Health Care Financing Review*, Annual Supplement 12 (1991), pp. 45–77; Rick Mayes and Robert A. Berenson, *Medicare Prospective Payment and the Shaping of U.S. Health Care* (Baltimore: Johns Hopkins, 2008); and Louise B. Russell, *Medicare’s New Hospital Payment System: Is It Working?* (Washington, DC: Brookings, 1989).

<sup>3</sup> Section 1115(a), title XIX, of the Social Security Act, Medicaid Demonstration, enabled Medi-Cal Hospital/Uninsured Care Demonstration Project Act (Waiver 11-W-0001 93/9). Other State law and regulations governing the SPCP are set forth in Welfare and Institutions Code sections 14081 et seq. and 14166 et seq., and California Code of Regulations, title 22, section 51541.

<sup>15</sup> CMS, “Medicare Program; Changes to the Hospital Inpatient Prospective Payment Systems and Fiscal Year 2008 Rates; Final Rule,” *Federal Register* 72:162 (Aug. 22, 2004), p. 47158.

<sup>16</sup> John Muldoon, “Pediatrics and DRG Casemix Classification,” in Norbert I. Goldfield, ed., *Physician Profiling and Risk Adjustment*, first edition (Gaithersburg, MD: Aspen Publishers, 1997).

- 
- <sup>17</sup> John H. Muldoon, "Structure and Performance of Different DRG Classification Systems for Neonatal Medicine," *Pediatrics* 103:1 (January 1999), pp. 302-318. The study referred to the previous CMS-DRG grouper. However, Medicare has not updated the grouping logic for newborns, so the problem persists with MS-DRGs.
- <sup>18</sup> Richard F. Averill, John H. Muldoon, James C. Vertrees et al., "The Evolution of Casemix Measurement Using Diagnosis-Related Groups," in *Physician Profiling and Risk Adjustment*, 2d ed., ed. Robert I. Goldfield (Gaithersburg, Md.: Aspen, 1999), pp. 391-454.
- <sup>19</sup> Kevin Quinn, "New Directions in Medicaid Payment for Hospital Care," *Health Affairs* 27:1 (January/February 2008), pp. 269-280. This evaluation compared APR-DRGs with CMS-DRGs. Because MS-DRGs were developed only for a Medicare population, it would be very unlikely for MS-DRGs to perform better than CMS-DRGs if the evaluation were to be re-done.
- <sup>20</sup> Centers for Medicare and Medicaid Services, "ICD-10-CM/PCS: An Introduction." (April 2010), downloaded from <https://www.cms.gov/ICD10/Downloads/ICD-10Overview.pdf>
- <sup>21</sup> Because of the central limit theorem, 30 stays is commonly, though informally, used as a threshold in defining whether a relative weight is stable. The question is whether the sample mean (i.e., DRG-specific resource use cost in one year) is likely to be a stable indication of the population mean (i.e., DRG-specific resource use in a broader time period). Lowering the threshold would enable more DRGs to be defined as stable but the essential problem of unstable relative weights for several hundred DRGs would remain.
- <sup>22</sup> Barbara O. Wynn and Molly Scott, *Evaluation of Alternative Methods to Establish DRG Relative Weights*, Report to the Centers for Medicare and Medicaid Services (Santa Monica, CA: RAND, April 2008).
- <sup>23</sup> Corroborating evidence can be found by comparing Medi-Cal average length of stay with national benchmarks by APR-DRG. In general, the two sets of figures line up very closely, with the exception of APR-DRG 640-2 discussed in the next footnote.
- <sup>24</sup> The anomaly is that a notable number of stays that grouped to this low-level DRG had unexpectedly high charges and length of stay, indicating that the patient was much sicker than the diagnoses and procedures shown on the claim would indicate.

---

<sup>37</sup> Xerox comparison of the simulation baseline dataset with American Hospital Association data, taking into account the exclusion of normal newborns from the AHA definition of discharge and assuming that the share in 2013 will be similar to what the share would have been in 2009. The Medi-Cal fee-for-service contribution to hospital inpatient would be lower than 12% because Medi-Cal volume includes large numbers of obstetric and normal newborn stays, which have lower-than-average casemix.

<sup>38</sup> California Welfare and Institutions Code §14105.28(b)(1)(a)(i)

<sup>39</sup> These include cost outlier payments, transfer adjustments, partial eligibility adjustments, etc. They are not relevant for purposes of this section.

<sup>44</sup> CMS, "Medicare Program; Changes to the Hospital Inpatient Prospective Payment Systems and Fiscal Year 2012, Final Rule." *Federal Register* 76:160 (August 18, 2011), p. 51553.

<sup>45</sup> CMS, "Medicare Program; Changes to the Hospital Inpatient Prospective Payment Systems and Fiscal Year 2008 Rates; Final Rule." *Federal Register* 72:162 (Aug. 22, 2007), p. 47181.

<sup>46</sup> For a Medicare population, APR-DRGs were found to be more accurate than CMS-DRGs or MS-DRGs. See Barbara O. Wynn and Molly Scott, *Evaluation of Severity-Adjusted DRG Systems: Addendum to the Interim Report*, Report to CMS (Santa Monica, CA: RAND Corp., July 2007), p. 13. For a Medicaid population, APR-DRGs were found to be more accurate than CMS-DRGs. A comparison between APR-DRGs and MS-DRGs has not been done but very likely would have the same result. See Kevin Quinn, "New Directions in Medicaid Payment for Hospital Care," *Health Affairs* (January/February 2008), p. 275.

<sup>47</sup> A notable example of CDIPs and hospital coding efforts includes Shands Hospital in Jacksonville, FL, where clinical documentation improvement specialists routinely "shadow" physicians "seeking clarification in real-time and making recommendations for how physicians can fine-tune documentation to enable more accurate coding." Chris Dimick, "Shadowing Physicians for Documentation Improvement" AHIMA Body of Knowledge Blog Post, (9/1/09). Also see Genna Rollins, "Clinical Documentation Improvement: Gauging the Need, Starting off Right," *Journal of AHIMA* 80, no.9 (September 2009): 24-29.

<sup>48</sup> One principal and 24 secondary diagnosis codes; one principal and 20 secondary surgical procedure codes.

<sup>49</sup> Technical reasons for excluding claims include DRG grouping errors, zero charges or payments, out-of-scope hospital types, incomplete stays, etc. See Table 1.13.1.

Regarding the consequent regulatory changes, see Centers for Medicare and Medicaid Services, "Medicare and Medicaid Programs; Interim and Final Rule," *Federal Register* 72:227 (Nov. 27, 2007), pp. 66886-66893.

<sup>61</sup> Medicare Payment Advisory Commission, "Report to the Congress: Medicare Payment Policy, Chapter 3 Hospital Inpatient and Outpatient Services," (Washington, DC: MedPAC, March 2011), pages 37-40 and page 49. Report downloaded from [http://medpac.gov/chapters/Mar11\\_Ch03.pdf](http://medpac.gov/chapters/Mar11_Ch03.pdf)

<sup>62</sup> CMS, "Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and Long-Term Care Hospitals Prospective Payment System Changes and Fiscal Year 2011 Rates; Final Rule," *Federal Register* 75:167 (August 16, 2010), pp. 50057-50067.

<sup>63</sup> While CMS estimated that an additional adjustment of 3.9% was needed "to forestall further overpayments," CMS concluded that an adjustment of 6.8% in a single year would be financially disruptive to many hospitals. *Federal Register* 75:167 (August 16, 2010), pp. 50057-50067.

<sup>64</sup> CMS, *IPPS FFY 2012 Final Rule*, p. 51497

<sup>65</sup> Medicare Payment Advisory Commission, "Comments on FFY 2012 Proposed IPPS Rule," (Washington, DC: MedPAC, June 2011), pp. 1-13

<sup>66</sup> MedPAC, *Report to the Congress* (March 2011), pages 37-40

<sup>67</sup> Findings from the MedPAC 2011 Report to Congress indicate that the share of cases without a CC or MCC declined more than 6 percentage points in 2008 and an additional 2 percentage points in 2009, while the shares of cases with a MCC increased by more than 6 and 3 percentage points, respectively. This figure includes 152 base DRGs that accounted for more than 54 percent of all cases in 2009. In 68 of these base DRGs, the cumulative shift from 2007 to 2009 in the share of cases toward the highest-weighted MS-DRG was at least 10 percentage points.

<sup>68</sup> Letter to Donald Berwick (Washington, DC: American Hospital Association, Association of American Medical Colleges, and Federation of American Hospitals, April 13, 2011); Rick Pollack, Letter to Dr. Donald M. Berwick, (Washington, DC: American Hospital Association, June 8, 2011), pp. 1-12

<sup>69</sup> These estimates reflect a simple linear regression based on actual data going back to 1997. Alternative estimates, using non-linear regression techniques (piecewise and quadratic) imply growth in real casemix of 1.1% to 1.8% in FFY 2008 and 3.1% to 4.8% in FFY 2009.

<sup>77</sup> Hospital bills to Medicaid rarely include non-covered charges, (UB-04 Form locator 48) so in practice billed charges and covered charges are almost always the same amount. Nevertheless, when there is a difference it would be inappropriate to consider the cost of patient convenience items and other non-covered services when determining eligibility for cost outlier payment.

<sup>78</sup> DRG base payment is after transfer adjustment, if applicable.

<sup>79</sup> The default CCR would be used by DHCS staff entering a new hospital into the provider master file. The default CCR would not be a parameter in CA-MMIS. Any hospital record in the provider master file without a CCR value would generate an error.

<sup>80</sup> Rebecca R. Roberts, Paul W. Frutos, Ginevra G. Ciavarella et al, "Distribution of Variable vs Fixed Costs of Hospital Care.," *Journal of the American Medical Association* 281:7 (1999), pp. 644-649.

<sup>81</sup> For the eight state-specific reports released in fiscal years 2005 and 2006 go to [www.oig.hhs.gov/oas/cms.asp](http://www.oig.hhs.gov/oas/cms.asp). For more recent projects see the U.S. Department of Health and Human Services, Office of Inspector General, "Work Plan Fiscal Year 2012" (Washington, DC: DHHS), Part III Medicaid Reviews, located at [www.oig.hhs.gov/reports-and-publications/workplan/index.asp](http://www.oig.hhs.gov/reports-and-publications/workplan/index.asp)

<sup>82</sup> Developers of DRG systems have sometimes dealt with this grouping issue by using death as one of the factors in assigning the DRG. APR-DRGs, however, are also used as a risk adjustor in measuring mortality rates, so death never factors into the group assignment, and to include it would be circular.

<sup>83</sup> Medi-Cal Provider Manual, California Children's Services (CCS) Program (cal child).

<sup>84</sup> DRG base payment is after transfer adjustment, outlier payments and separately payable supplies and devices, if applicable.

<sup>85</sup> An alternative would be to pro-rate the payment using the proportion of covered days to total days. For example, if the stay were 20 days and the covered days were 10 days, then the payment would equal 50 percent of the amount otherwise payable. This option is less consistent with the principle of DRG payment, since a hospital could provide well more than the average amount of care for a particular DRG and still see its payment pro-rated. This option would also be more complex both in terms of CA-MMIS design and in operation, because it would require look-ups and editing for validity not only of the "from" and "through" dates of service (which have to match the eligible days) but also to the admission and discharge dates. Discharge date is not a field on the inpatient form, but instead is a particular value within the occurrence code field. It is not often used in claims processing.

<sup>93</sup> Patient Protection and Affordable Care Act, Public Law 111-148, Section 2702, enacted March 23, 2010

<sup>94</sup> Facilities excluded from Medicare's HAC & POA payment policy include critical access hospitals (CAHs), long-term care hospitals (LTCHs), hospitals in Maryland operating under waivers, cancer hospitals, children's inpatient facilities, rural health clinics (RHCs), federally qualified health centers (FQHCs), religious nonmedical health care institutions (RNHCI), inpatient psychiatric facilities (IPFs), inpatient rehabilitation facilities (IRFs), and Department of Veterans Affairs and Department of Defense hospitals.

<sup>95</sup> CMS, "Medicaid Program; Payment Adjustment for Provider-Preventable Conditions Including Health Care-Acquired Conditions," *Federal Register*, final rule, 76:108 (June 6, 2011), p. 32817. Though the citation is to a Medicaid rule, the reference is to a Medicare HAC.

<sup>96</sup> Analysis based on data published by CMS, "Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System Changes and FY 2012 Rates," final rule, *Federal Register* 76:160 (Aug. 18, 2011), pp. 51512–51520

<sup>97</sup> In FY 2011, Medicare reported similar results for FY 2009: only 0.12 percent of over 9.3 million stays included a HAC. For stays where the HAC affected the DRG assignment, payment was reduced for only 0.04 percent of stays. Analysis based on data published by CMS, "Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System Changes and FY 2011 Rates," final rule, *Federal Register* 75:157 (Aug. 16, 2010), pp. 5008–50101.

<sup>98</sup> In general, designated public hospitals are outside the scope of this document. We have included them in this discussion because HCACs as a policy topic apply to both DRG hospitals and designated public hospitals.

<sup>99</sup> We appreciate the permission received from the South Carolina Department of Health and Human Services to share this information with other states.

<sup>103</sup> This will substantially reduce TAR-related administrative work for both the Department and the hospitals. We note, however, that no changes are planned in TAR requirements related to the admission itself. Approximately 170,000 stays (38% of the total) that are neither deliveries nor normal newborns will continue to require review of the medical necessity of admission.

<sup>104</sup> This estimate is based on the simulation dataset, which assumes that the only change in the volume and mix of inpatient stays between 2009 and 2013 stems from the managed care transition. Unexpected changes in the volume and/or mix of inpatient stays would affect the TAR estimates shown in Table 5.1.2.

<sup>105</sup> Non-contract hospitals are paid at a percentage of charges subject to cost settlement after the end of the fiscal year.

<sup>106</sup> A total of 196 large hospitals (over 100 beds) had long stays, with an average length of stay of 56 days. A total of 10 small hospitals (under 50 beds) had long stays, with an average length of stay of 61 days. One hospital had an uncharacteristically long stay of > 180 days, which skewed the ALOS for small hospitals.

Berenson, *Medicare Prospective Payment and the Shaping of U.S. Health Care* (Baltimore: Johns Hopkins, 2008); and Louise B. Russell, *Medicare’s New Hospital Payment System: Is It Working?* (Washington, DC: Brookings, 1989).

<sup>115</sup> “Short stays” can be defined as any patient with a length of stay less than, say, 0.25 times the national average length of stay for that APR-DRG, thereby controlling for differences in casemix among patients.

<sup>116</sup> U.S. Department of Health and Human Services, Office of Inspector General, *Work Plan FY 2012* (Washington, DC: DHHS, 2011), available at [www.oig.hhs.gov/reports-and-publications/workplan/index.asp#current](http://www.oig.hhs.gov/reports-and-publications/workplan/index.asp#current).

<sup>118</sup> Consider a hospital with \$10 million in revenue, \$9.8 million in cost and \$200,000 in profit. If Medicaid fee-for-service inpatient cost equals \$392,000 or 4% of the total, then a 10% reduction in cost would increase profit by an additional \$39,200, or 20%.

<sup>119</sup> Kevin Quinn, “Achieving Cost Control, Care Coordination and Quality Improvement in the Medicaid Program,” *Journal of Ambulatory Care Management* 33:1 (January-March 2010), pp. 39-40; Kevin Quinn and Connie S. Courts, *Sound Practices in Medicaid Payment for Hospital Care* (Hamilton, NJ: Center for Health Care Strategies, 2010), pp. 9-10.

<sup>120</sup> The figures reflect the simulation dataset. “NICU” stays are defined by APR-DRG assignment, not necessarily by provision of care within a neonatal intensive care unit.

<sup>121</sup> Xerox State Healthcare LLC analysis of OSHPD data for 2009.

<sup>122</sup> Associated hospital cost was estimated by multiplying average hospital per day for each APR-DRG by the number of days that exceeded the national benchmark. The calculation is illustrative, not definitive. In particular, the days that can be reduced through improved length of stay management tend to be the least expensive days.
